Production

Time scale

# Humboldt Current System

- ✎ One of the major EBUS, Great climatic variability, Intense OMZ
- ✎ World most productive area for fish (0.1% world ocean ~10% catches)
- ✎ Large industrial fishery (>1000 vessels,  $\sim 6 \cdot 10^6 \text{t} \cdot \text{y}^{-1}$ )
- ✎ Large guano producing seabird populations ( $\sim 4 \cdot 10^6$  ind.)
- ✎ Ecosystem-based fisheries management issues

# Humboldt Current System

- System recently highly productive (Field, Gutiérrez, S1)
- 1946: Nesting reserves (Duffy et al. 1989)  
-> population size from ~10 to 20 millions  
Reference population size?
- 1950': Development of the forage fish industrial fishery
- 1972/73, 1982/83, 1997/98: Intense Niño events  
crash of the fishery and seabirds
- Since 97/98, anchovy recovered, but seabirds did not

# Benguela Current System

**Foraging**

**Breeding**

**Demography**

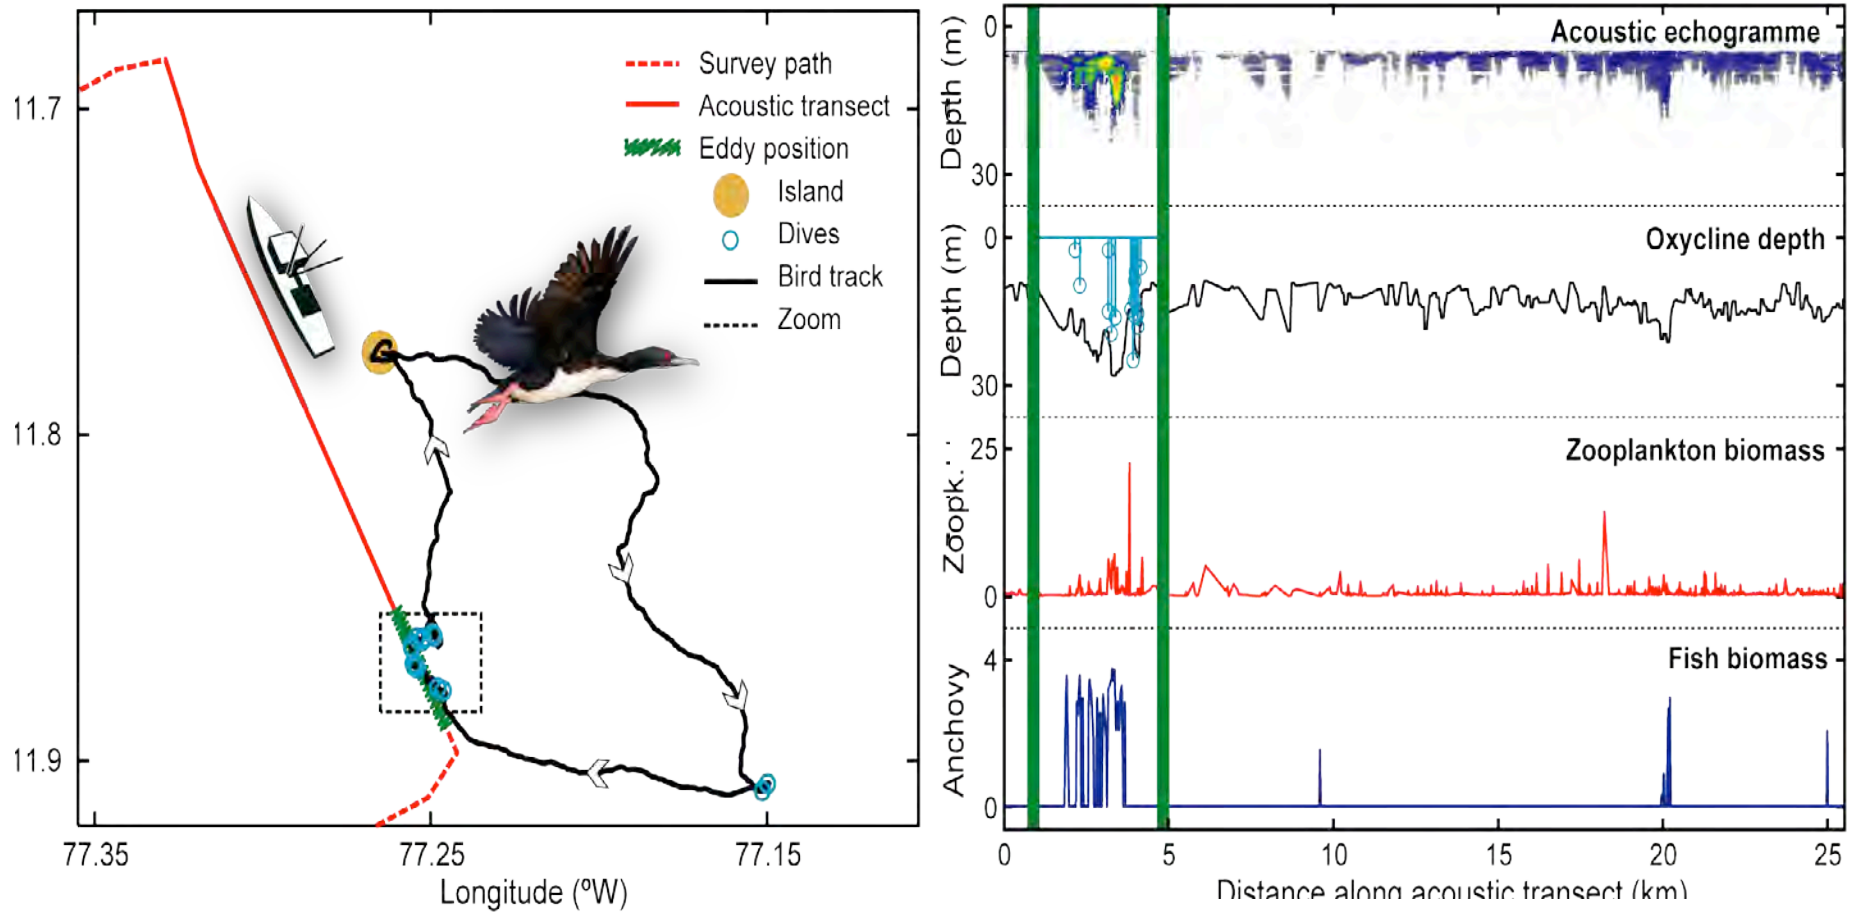

**Where?**

# Humboldt Current System

Seabirds fine scale foraging  
Relies on small scale (1-4km) , transient pelagic 'oasis of life'  
CC impacts -> Grados et al. S1 07/03

# Humboldt Current System

Tracking at the opening of fishing season

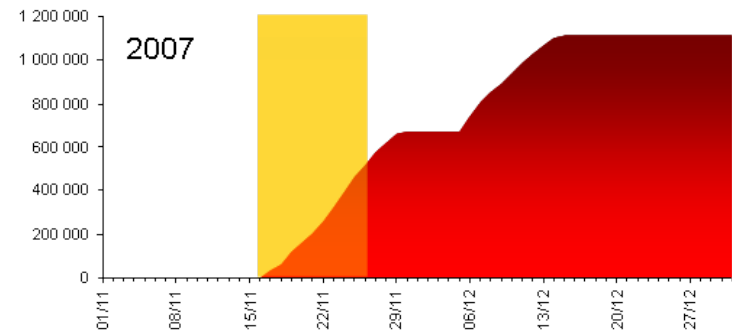

Seabird foraging effort increase day after day, seabirds forage farther from vessels

Mixed effect models:

Main effect from the local depletion generated by the fishery removals

Seabird needs:  $\sim 200 \text{ t.d}^{-1}$

Fishery removals:  $\sim 50\,000 \text{ t.d}^{-1}$

**Competition seabirds / fishery**  
**Localized depletions**

# Humboldt Current System

$\Delta$  foraging effort of breeding seabirds  
Relative contribution of climate, prey and fishing

Random Forests

2008-2013 time series

10 response variables =  $f(43 \text{ covariates})$

Ordering effects and quantifying contributions

# Humboldt Current System

# IBM approach

Prey abundance

Prey depth

Seabird foraging probability

A virtual lab for studying the effects of ecosystem and fishery management changes

# Humboldt Current System

(a) Peruvian Boobies

Guanay Cormorants

(b)

(c)

**Foraging effort variability**  
**Foraging success**

**Abundance and distribution of prey**

Depth = primary factor of seabird foraging success

**Prey accessibility +++**

**Boyd et al. (2016) JAE**

**Social information**

Important when prey spatially concentrated and for mitigating poor foraging conditions

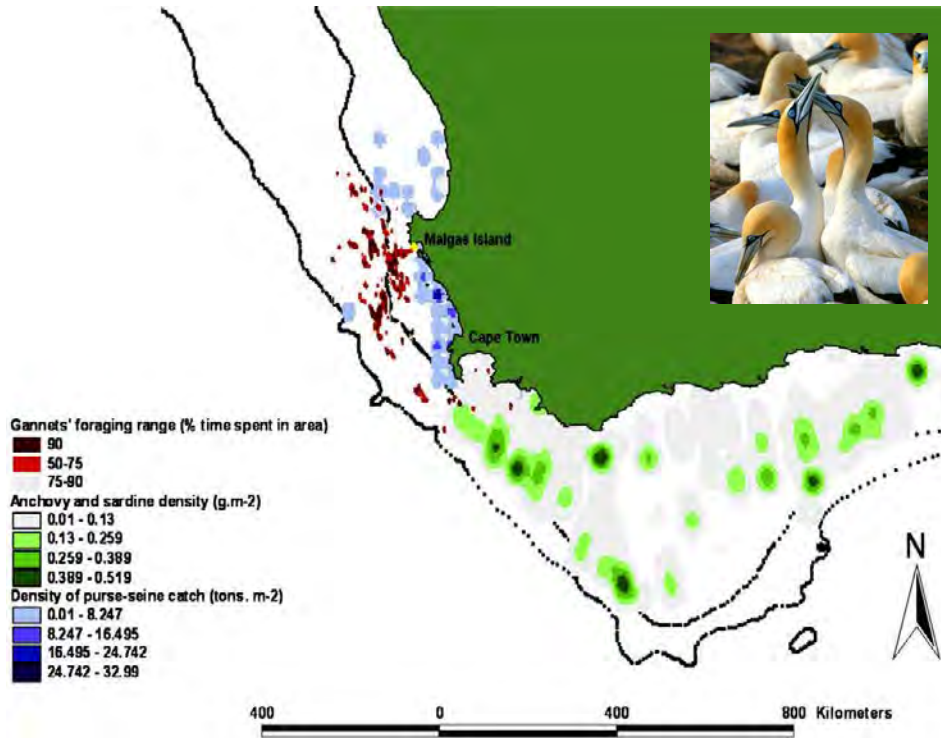

Seabird population size -> efficient foraging

**Boyd et al. (2016) Behav. Ecol.**

# Benguela Current System

## Competition for Shifting Resources : Seabirds versus Purse-Seine Fisheries

Seabird populations decreasing  
Reduced availability of pelagic fish.

GPS-tracking of the birds,  
Echo-sounding of pelagic fish  
Vessel log books

2007: purse-seine fishing grounds and gannet foraging areas overlapped by only 13% but purse seiners caught 41% of seabird food needs

-> considering and experimenting with **at-sea 'no-take' areas for the purse-seine fishery**

# Benguela Current System

**Interannual variability:  
Unprofitable foraging and starving seabirds**

## Benguela Current System

**African penguins  
Postnatal dispersal  
GPS tracking**

**Juveniles go to low SST,  
high Chlo areas that were  
once reliable cues for prey-  
rich waters**

**-> Marine ecological trap**

**Foraging**

**Breeding**

**Demography**

**When?**

# Humboldt Current System

Monthly presence-absence of breeders

1952-1968

1977-1990

2003-2014

**Dynamic occupancy models**

**Covariables: oceanographic conditions, anchovy production, fishery removals**

# Humboldt Current System

## Bayesian dynamic occupancy models

Breeding onset seasonality ~ env. Parameters seasonality by period

Periods Species	1952-1968	1977-1990	2003-2014
	SST Anch. Prod.	SST Chlo	SST Oxy. depth
	SST Anch. Prod	SST Oxy. depth	SST Oxy. depth
	SST Anch. Prod	SST	SST Oxy. depth

## Species-specific breeding adjustment

A shift of 'abundance-driven' versus 'accessibility - driven' breeding seasonality?

**Foraging**

**Breeding**

**Demography**

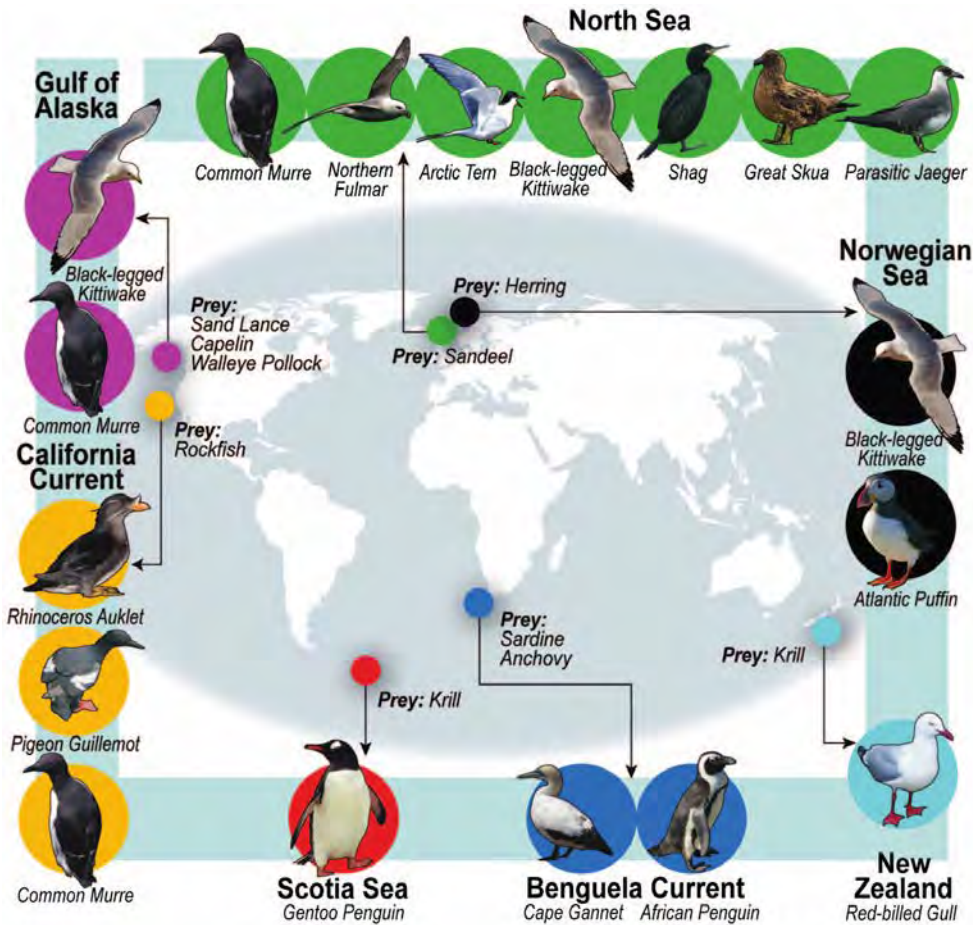

**How much?**

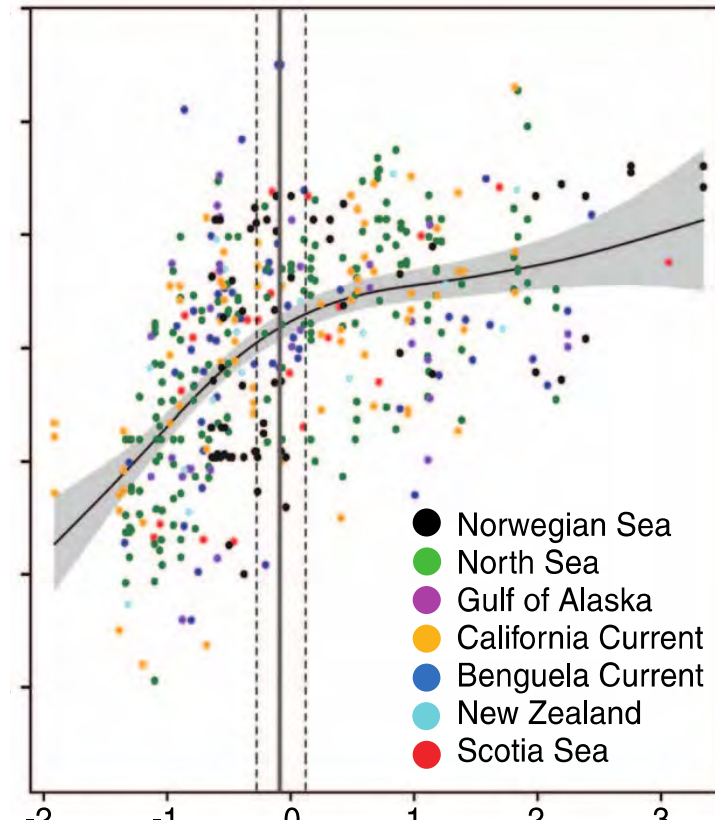

# Prey abundance (biomass) -> breeding success

species considered in our analysis.

Cury et al. 2011

Robinson et al. 2015

1 / 4 Bmax

Punt et al. 2016

<10%

7 ecosystems 14 species

Penguin SA

Brown Pelican California

# Humboldt Current System

Prey abundance (new production) -> seabird consumption vs. Fishery removals

- Anchovy production
- Fishery removals
- Seabird removals

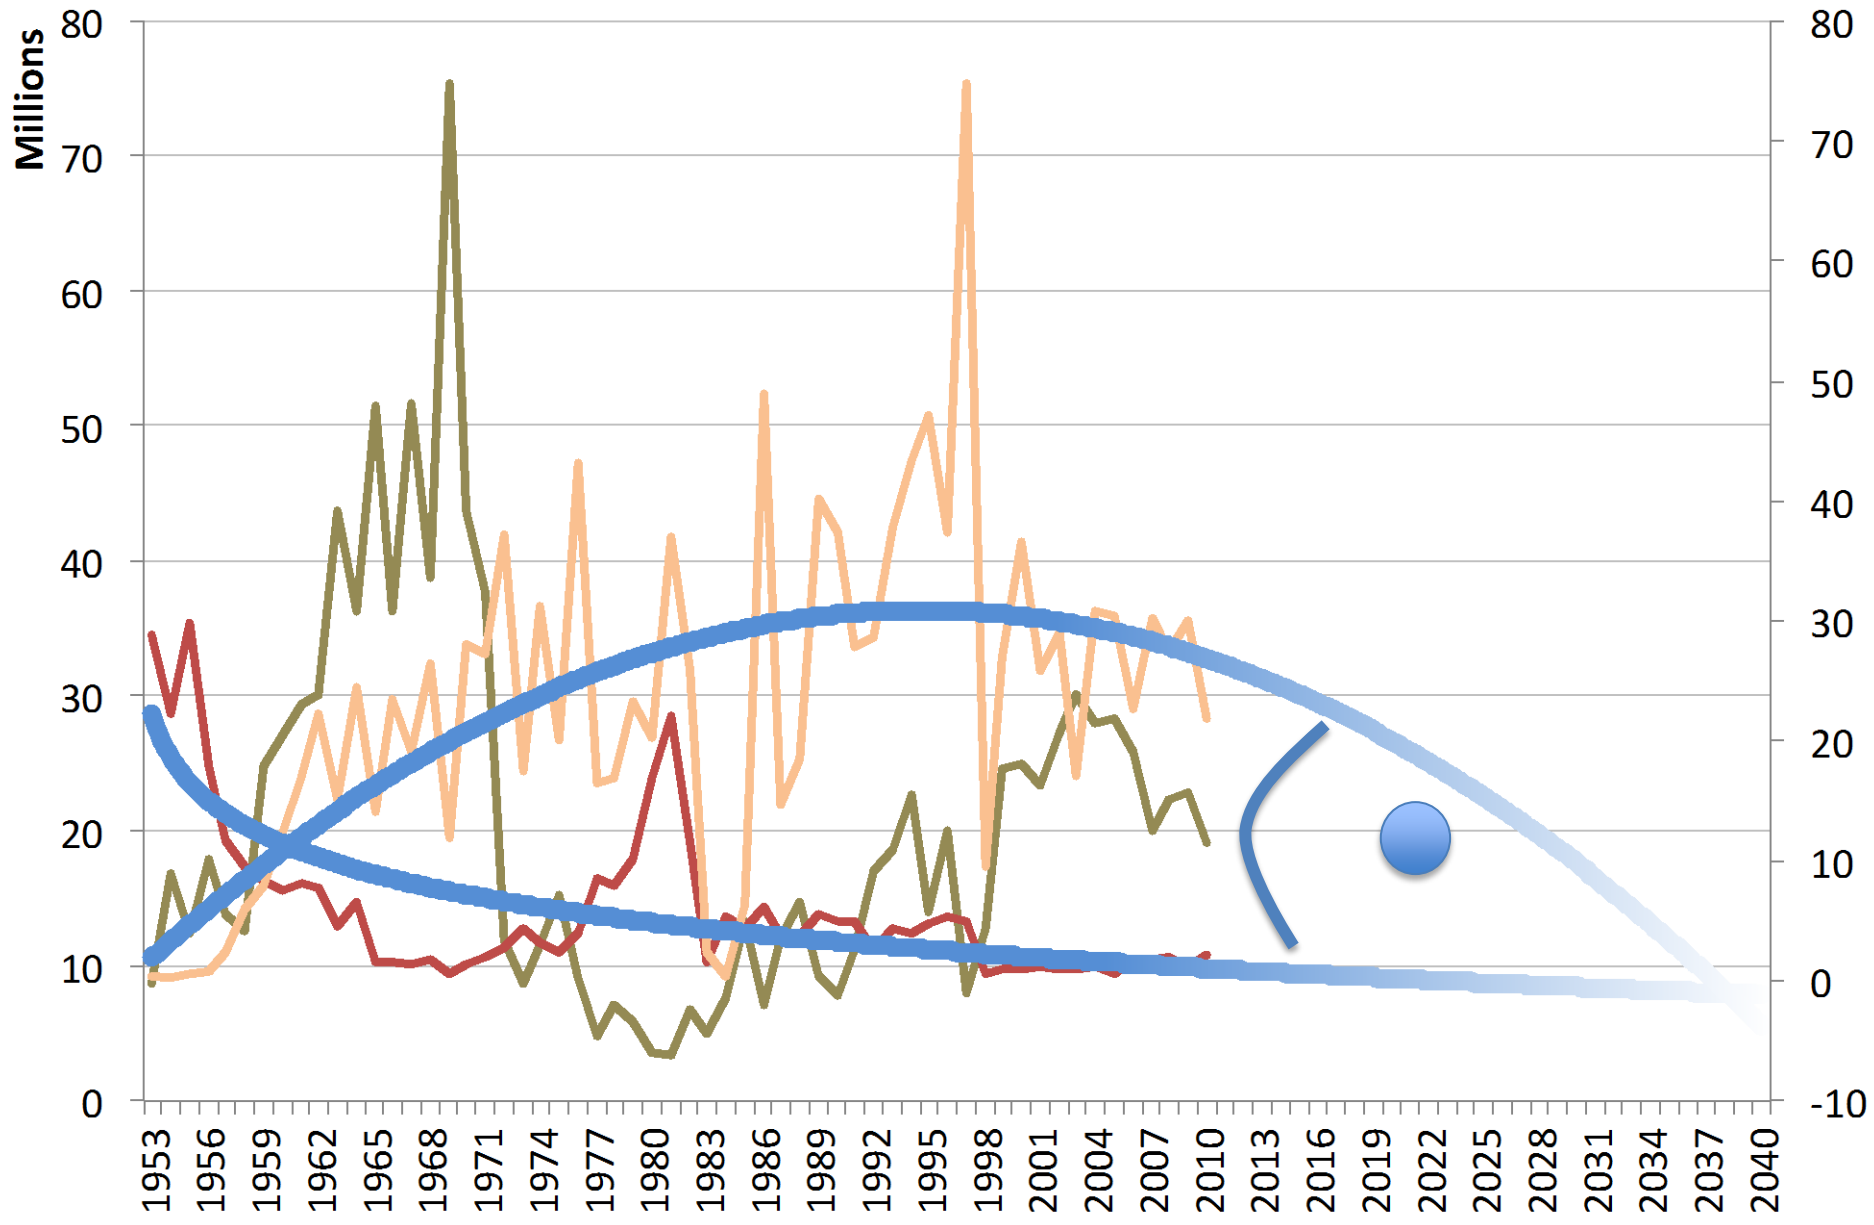

# Humboldt Current System

**Cormorants  
Crashed in 60-65**

**Much before  
Fishery Removals > 30%**

# Humboldt Current System

So what?

# Benguela Current System

Purse seine fishing exclusion  
10nm around main penguin  
colonies since 2008

**Marine no-take zone rapidly  
benefits endangered  
penguin**

**Pichegru et al 2010  
Biol. Let.**

## Management Implications

- **Diversify modelling/simulation tools: IBM, MICE (Punt et al. 2016)**
- **Management objectives** for the ecosystem
  - > target for seabird population size ,  
especially those requiring large numbers for efficient foraging
  - > Think at seabird communitiy level
- **Ecosystem-based fishing quota definition (CCAMLR ):** adaptive quota with biomass escapement rule (e.g krill Antarctica, anchoveta Peru)...
  - > 1/3 for the birds not always enough
- **Temporal pattern of fishery removals** do count:
  - > Overcapacity and race for fish-> localized depletions (IQs?)
- FF abundance not enough, **prey availability >>>**
  - >adaptive regional quotas, fishing closures in areas surrounding seabird colonies (critical periods for abundance and/or accessibility)
