

Toward socially responsible governance of marine climate interventions

Sarah Lawless, Emily Ogier, Georgina Gurney, Robert Streit, Philippa Cohen, Rebecca Gruby, Sisir Pradhan, Tiffany Morrison

Oceans are getting warmer.

More than 90% of the Earth's excess heat is stored in the oceans.

The warming of oceans is the result of human-induced climate change.

Marine heatwaves have doubled in frequency in the past 30 years.

The surface layers of the oceans warm more quickly than the deeper layers.

Social benefits and risks of interventions at local scales is unclear

The 50 countries with the highest relative reliance on marine resources for nutrition and livelihoods

(adapted from Selig et al. 2019; Cohen et al., 2023)

How are social risks and benefits of new marine climate interventions considered and accounted for?

Methodology

- Global survey scientists and practitioners (n=243)
- Key-informant interviews with best-practice leaders (n=7)
- Policy analysis of influential intervention regulations and guidance (n=10)

Analysis: socially responsible innovation framework

Anticipation: How are potential social risks, harms and benefits accounted for?

The level of foresight given to both the intended and potentially unintended distal and proximate social impacts.

Responsiveness: What social accountability mechanisms exist?

The presence and effectiveness of regulatory and institutional governance mechanisms to guide, account for, and manage social implications.

Inclusion: How accessible and inclusive is public and stakeholder engagement?

Accessibility and inclusiveness of public and stakeholder deliberation on the visions, purposes, questions, and dilemmas of interventions.

Reflexivity: How is responsibility and competency to account for social impacts allocated?

The institutional assignment of responsibility (moral labour) and competencies to interrogate the social and ethical dimensions and implications of interventions.

Developing a framework for responsible innovation

Jack Stilgoe^{a,*}, Richard Owen^{b,1}, Phil Macnaghten^{c,d}

Lawless et al., *in review*

Marine climate interventions reported by survey respondents

Anticipation

Limited practices, models, and methodologies to account for potential social benefits and harms

- Feasibility assessments predominately relied on biophysical data (63.3%)
- Economic data served as the only social data source for 48.7% of interventions
- Social risk assessments were absent in majority of cases

*“Social, cultural, and economic feasibility do not seem to be on the radar currently”
(assisted evolution of marine species)*

Inclusion

Inclusive public engagement was constrained by narrow and formalized deliberation opportunities

- Inclusive deliberation only occurred for 14.5% of interventions
- Most public deliberation opportunities were through formal channels (61.3%), and sought 'social license to operate'

“Communities are usually consulted or informed well after plans have already moved ahead or received investment” (natural stabilisation of reefs and coasts)

Organisational competency and accountability for social impacts remains low

Reflexivity

- Only one best-practice leader was actively building their internal social and ethical expertise. In other cases expertise was either outsourced or not present.
- We found evidence of social responsibility being transferred onto external parties or abrogated.

I work with national jurisdictions and hope they do it [benefit distribution] equitably and responsibly... My job is to prove the ecology dimensions , it's then up to local structures to ensure [benefit] sharing.” (key-informant)

Responsiveness

Social accountability mechanisms are rarely formally mandated

- Regulatory mechanisms (federal/state policies, permitting systems), are not serving as adequate social safeguards. Social considerations shallow or absent.
- Impetus upon leaders to voluntarily account for social risk e.g., Indigenous and community engagement protocols and internal ethics procedures

“We have ethics process that are not required and not imposed [by regulators], but we have chosen to adopt. So internally we also have a lot of oversight layers.” (key-informant)

How to prompt more socially responsible governance?

Anticipation

Anticipatory measures need to account for fundamental justice considerations

Inclusion

Need inclusive public engagement that values diverse worldviews and knowledge sources

Reflexivity

Build organisational social and ethical competencies, and effective allocation of labour for socially responsible practice

Responsiveness

Increased connection with policies, legal frameworks, interventions / organisation that centre human rights
