What fraction is occupied by submesoscale features?

How patchy is the ocean?
How do you quantify patchiness?

Relationship between patchiness and productivity?

The Heterogeneity Index (HI) [0 1]

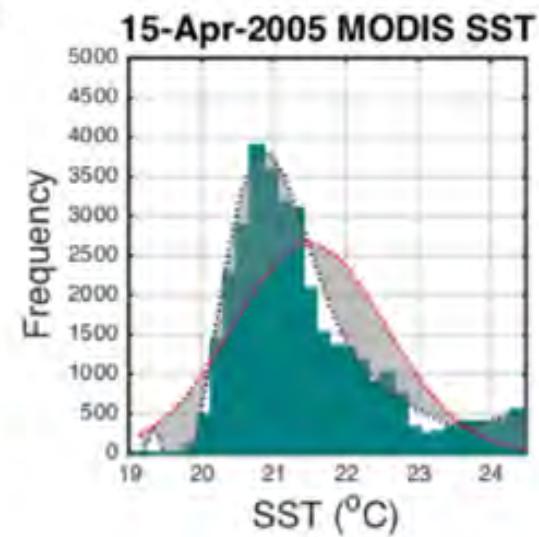

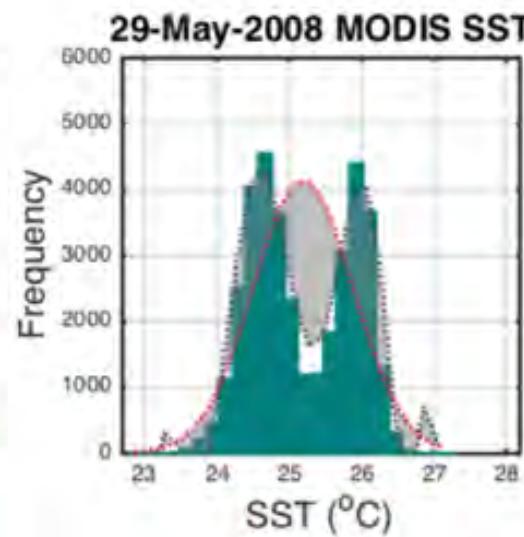

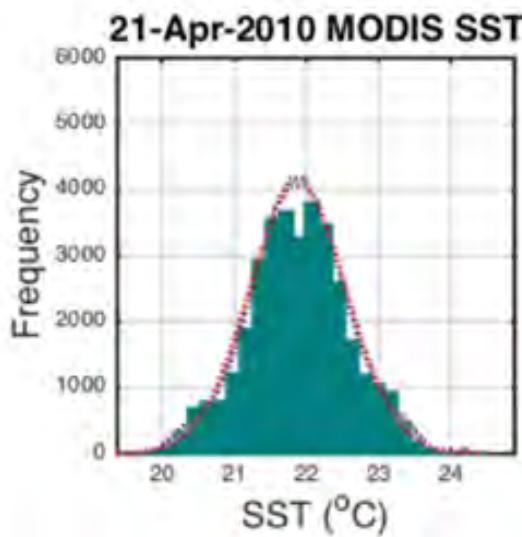

A new metric for ocean surface patchiness using
MODIS/Aqua 1-km SST

$$HI = a \left(b |\gamma| + c \frac{\sigma}{\sqrt{n}} + d P \right)$$

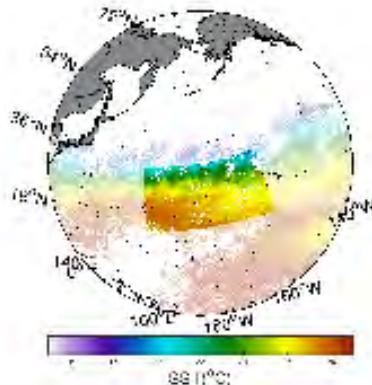

skewness

standard deviation

misfit between polynomial
and normal fits

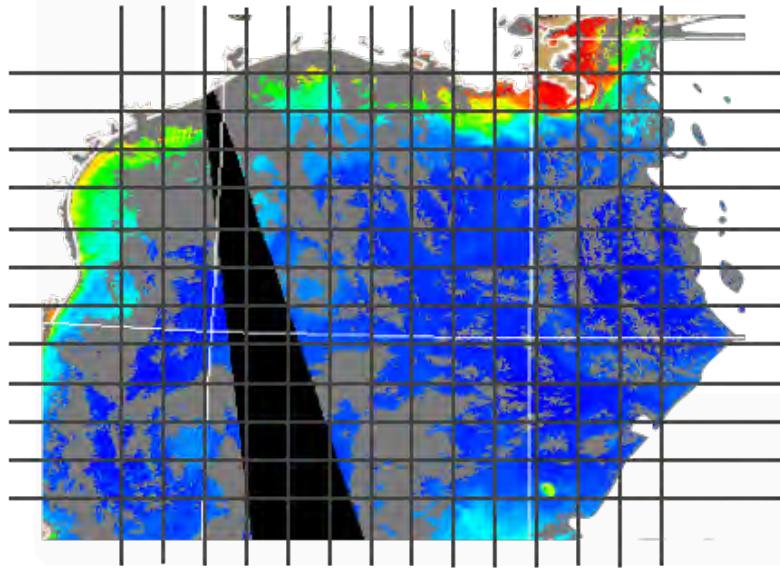

The Heterogeneity Index (HI) [0 1]

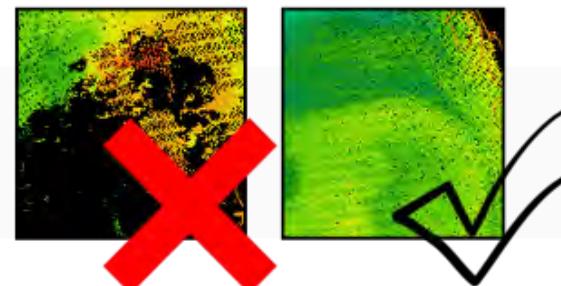

A new metric for ocean surface patchiness using
MODIS/Aqua 1-km SST

$$HI = a \left(b |\gamma| + c \frac{\sigma}{\sqrt{n}} + dP \right)$$

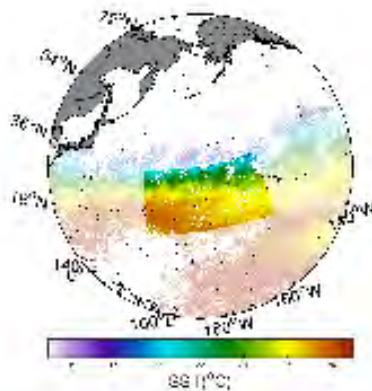

- MODIS-Aqua 2002-2015
- Spatial resolution: ~ 1 km
- 32,222 100x100 km images
- Average SST coverage 86%
- average Chl coverage 79%

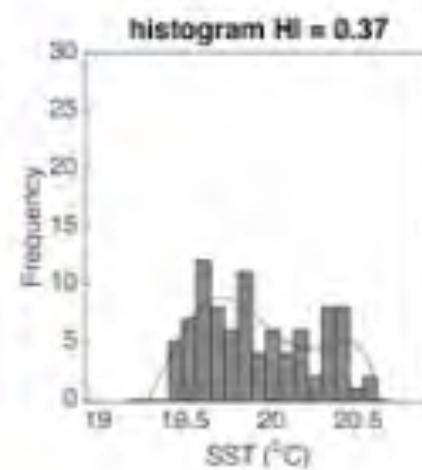

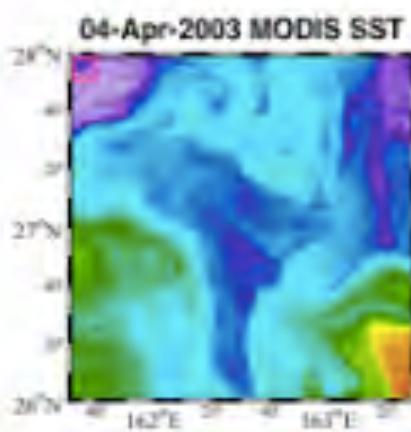

Liu and Levine, 2016

Water column responses?
Ecosystem and carbon dynamics?
Climate impact and feedbacks?

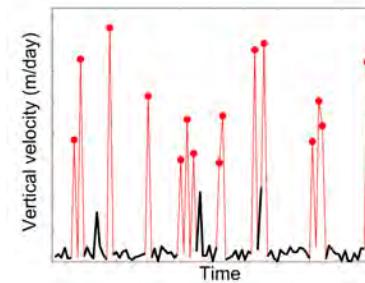

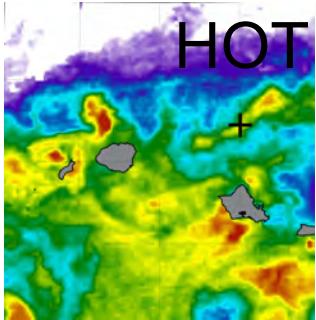

Spatially Heterogeneous Dynamic Plankton Model (SHiP)

What is the probability of a
submesoscale front forming?

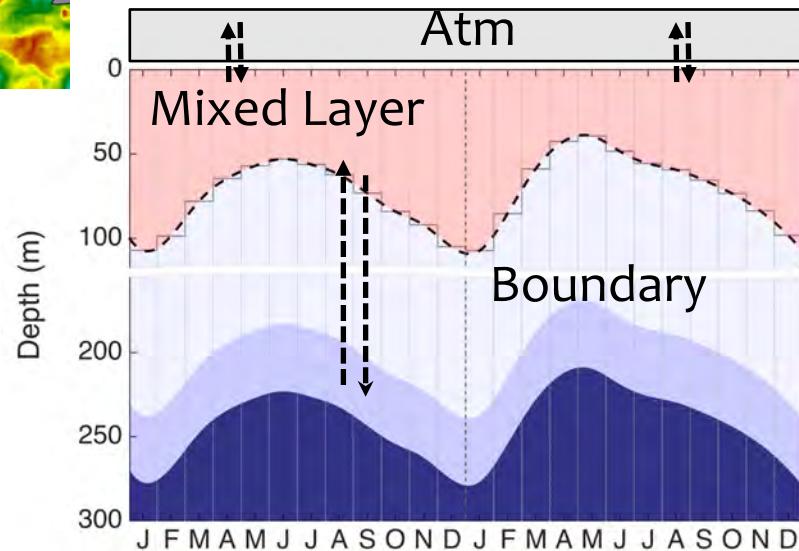

- Episodic nutrient delivery based on probability of disturbance (x)
- Track fractional areas of environments
 - Common disturbance history
 - Variable fractional area
- Dynamic biogeochemistry and ecosystem

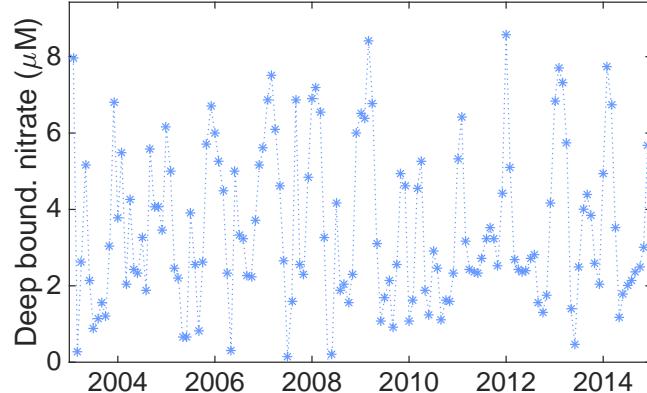

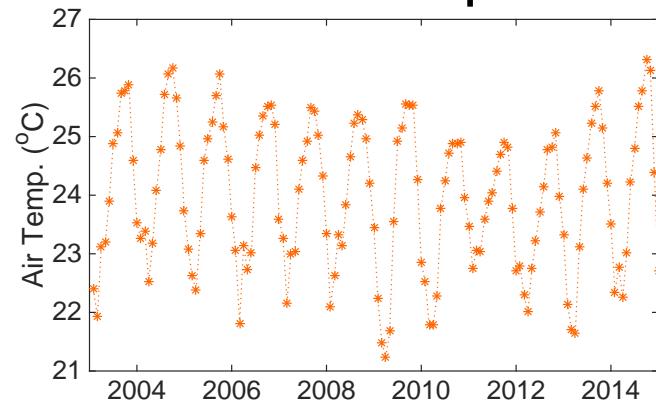

SHiP Mixed Layer Model @ HOT

The impact of fine-scale processes on large-scale carbon cycling

Take home messages:

- Submesoscale features ubiquitous
- Increased fine-scale patchiness results in higher chlorophyll (consistent with idealized model results)
- Changes in submesoscale dynamics could offset (augment) warming
- New modeling approach that SHiP captures observed fine-scale variability
