Question

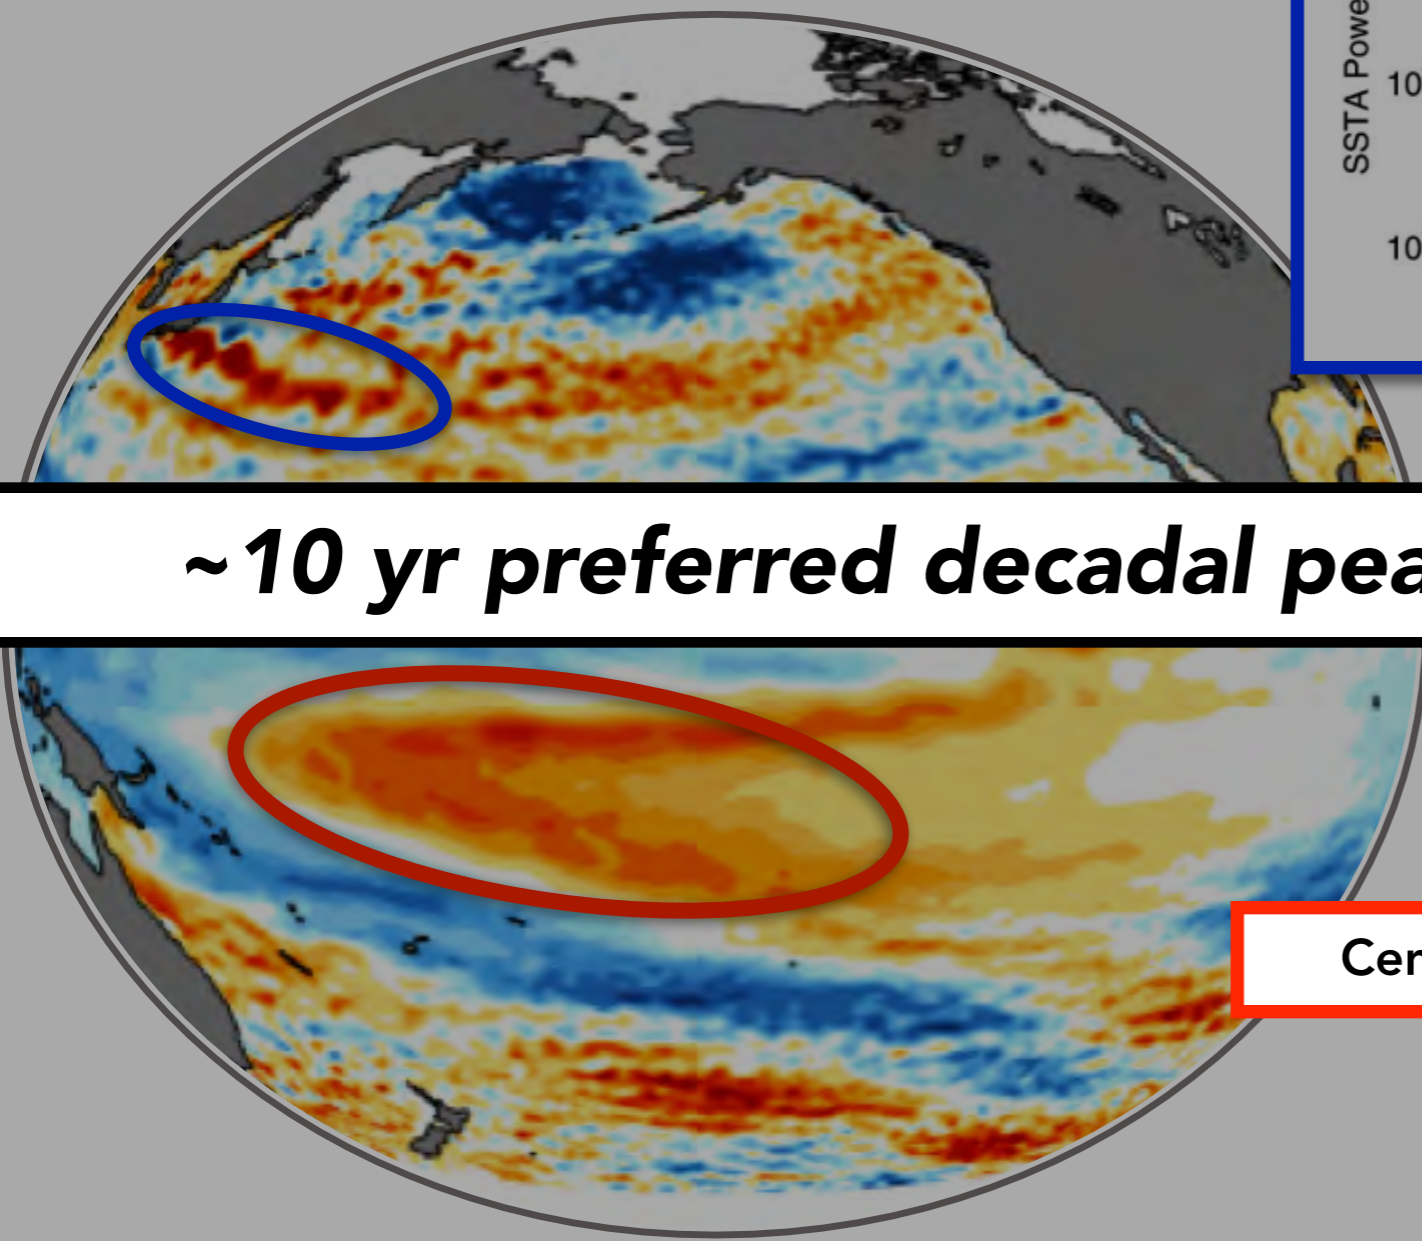

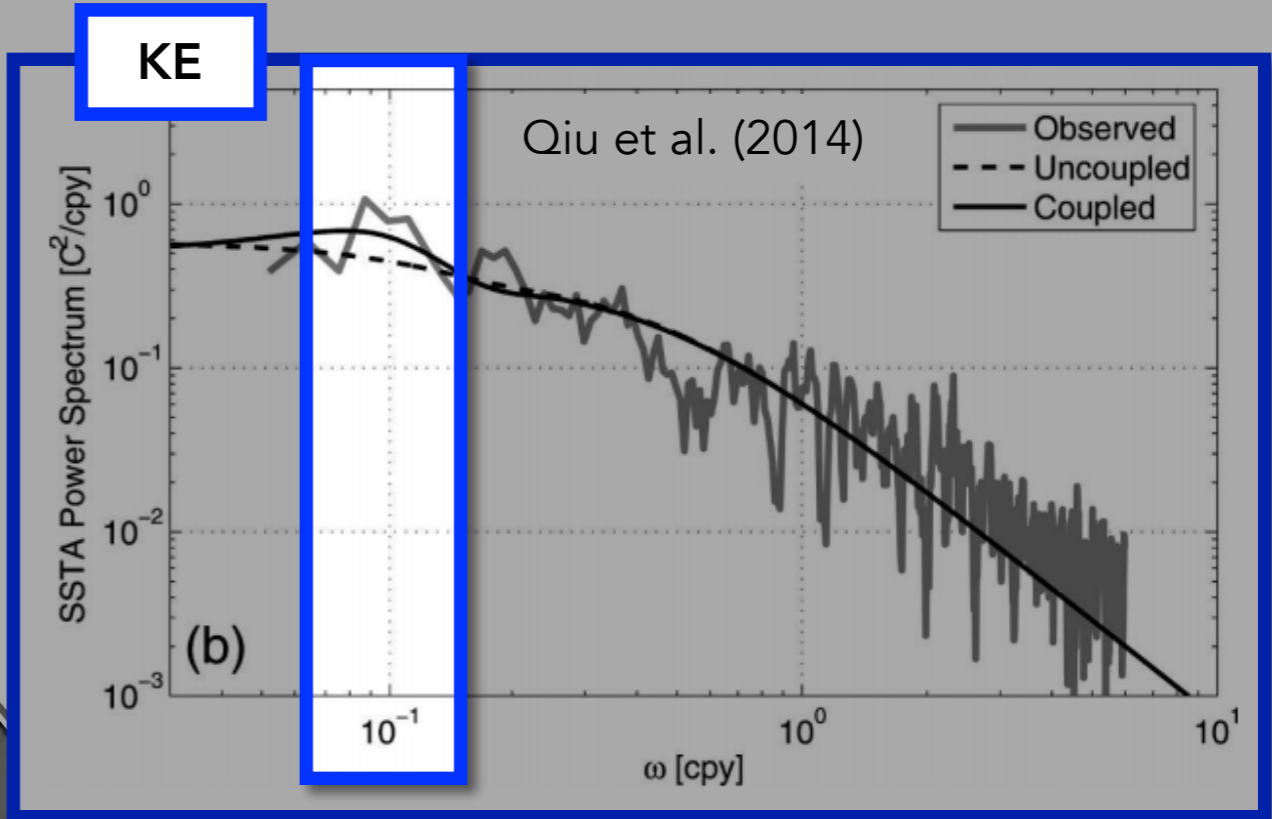

What is the relation of the decadal KE variability with a strong signature also in the tropics ?

0.4

Correlated SSHa to KE

Correlated SSHa to KE

Central Pacific ENSO

Central Pacific

Correlated SSHa to KE

KE

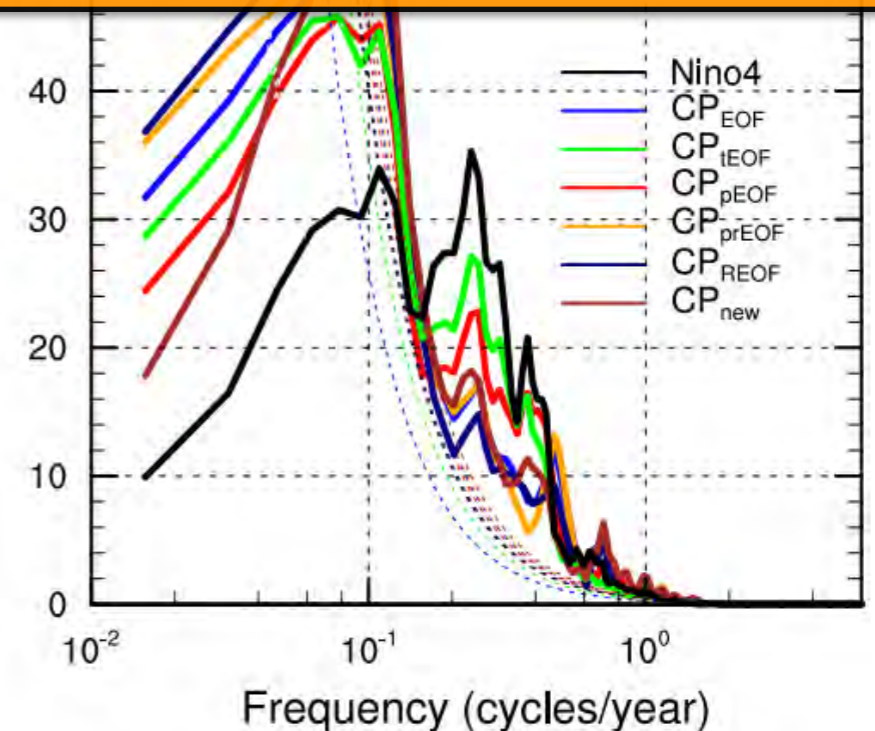

GOAL

To show that KE system and tropics are linked and give rise to a preferred quasi-decadal timescale (~ 10 yr).

a) PMM regression pattern

Stuecker (2018) 1 [m/s]

1. The KE wind response is connected with the PMM.
2. The signature of PMM can be represented by the KE variability

temporal lead/lag relationship between the KE and PMM?

Ecological responses to climate changes and their applicability to ecosystem predictions?

1. provides *a basis for decadal predictability of biophysical environment* since the KE and PMM both exert significant influences on SST and regional water mass formation and transformation processes in the North Pacific.

2. suggests *the amplified linkage between KE-PMM under anthropogenic forcing* that leads to stronger decadal fluctuations of biophysical quantities (e.g., salinity, oxygen, chlorophyll-A) in the North Pacific

Supplemental Figures

KE dynamic state

Qiu et al. (2014)

*Note that the terminology “stable” versus “unstable” is to indicate the dynamic state of the KE system, doesn't necessary mean the condition for instability of the KE jet.
