

# UPTAKE AND PATHWAYS OF COASTAL ADAPTATION PROCESSES IN AUSTRALIA

COASTAL COLLABORATION CLUSTER: MEETING COASTAL CHALLENGES

Débora M. DE FREITAS  
Laura STOCKER  
Richard KENCHINGTON

# AUSTRALIAN COASTAL CITIES

Sydney

Population ~ 21 million  
coast ~ 6.5 million

85% of Australians  
live under  
50km from the  
coast

New South Wales ~ 80% -  $\leq$  3km

# GROWING NEEDS

## Infrastructure and services

- Water supply
- Electricity supply
- Telecommunications
- Sanitation
- Food delivery
- Road and railway systems

## Governance and planning

- Complexity - policy levels from federal to local, governments, decision-makers and citizens

## INCREASING EXPECTATION

# GROWING CHALLENGES

## Erosion

## Flooding

ENHANCED BY ENVIRONMENTAL CHANGES

# GROWING CHALLENGES

Within 200m of the coastline	
Regional infrastructure	120 ports
	5 power stations/substations
	3 water treatment plants
	170 unidentified industrial zones
	1,800 bridges
Community services and facilities	258 police, fire and ambulance stations
	75 hospitals and health services
	46 government administration facilities
	360 universities, colleges and schools
	102 retirement/nursing homes
	11 emergency services facilities
	41 waste disposal facilities

**Hospital, Cairns (QLD)**

**Airport, Sydney (NSW)**

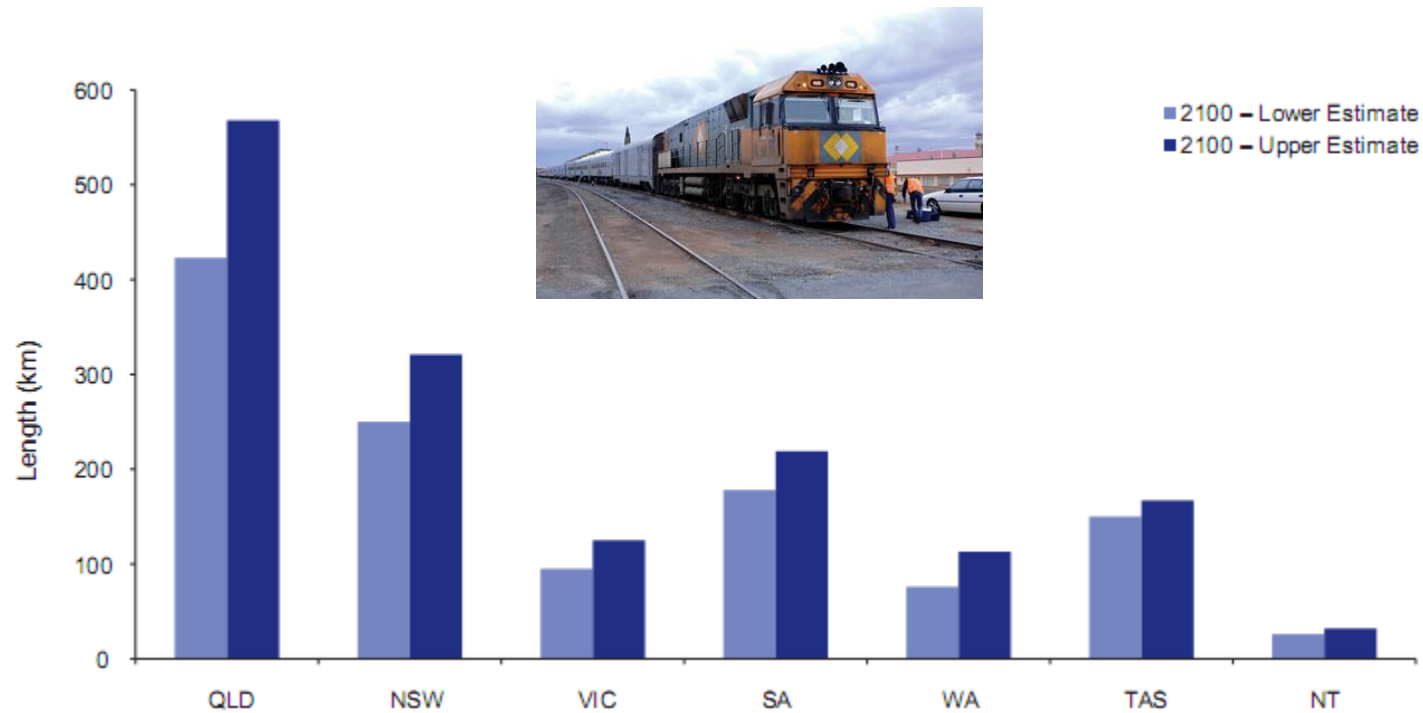

**Sewage plant (NSW)**

(Source: Geoscience Australia 2009 in Developing a national coastal adaptation agenda 2010)

# GROWING CHALLENGES

## EXAMPLE: RAIL AND TRAMWAYS

Estimated length of existing rail and tramway infrastructure at risk from the combined impact of inundation and shoreline recession for sea level rise.

Nationally: 1,200 - 1,500 km of rail lines and tramways potentially at risk from inundation and shoreline recession from a sea level rise of 1.1 metres

# MANAGEMENT ISSUES

- Adaptation coastal zone plans to sea level rise scenarios – zones (current, 2050, 2100)

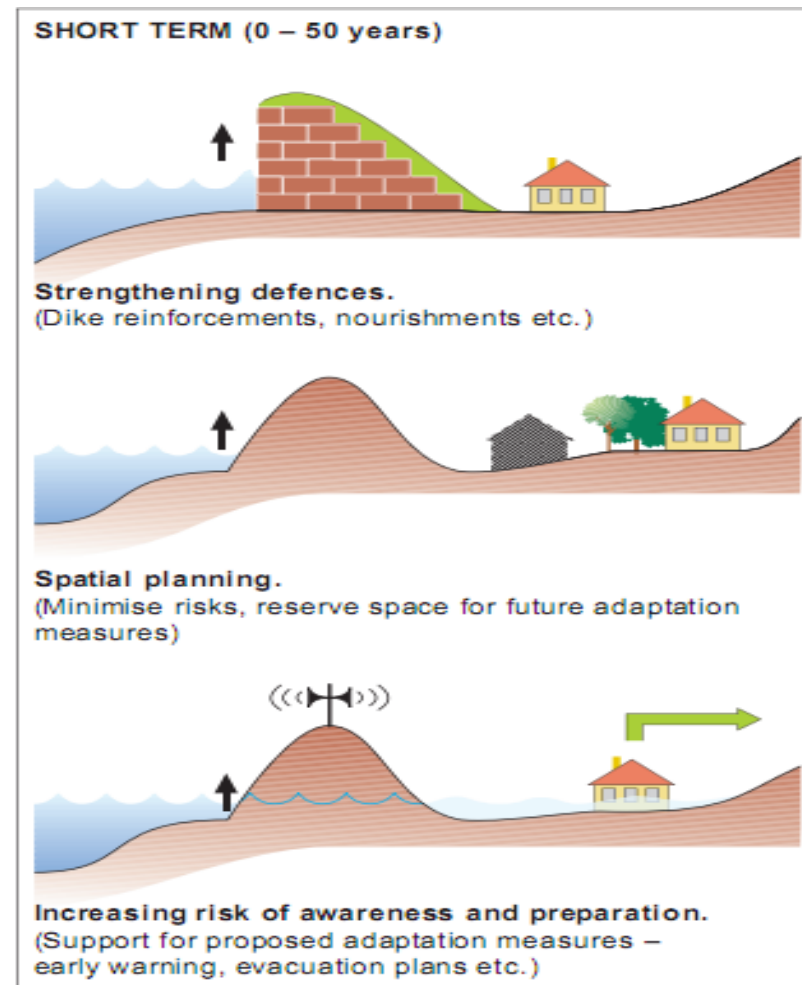

0.4m

1.1m

- Management Options

- Protection (seawalls, sandbags, rising house floors)
- 'Planned' Retreat (hazard lines)
- No action

**ADAPTATION** focus

Source: *Climate Change Risks to Australia's Coast* 2009:146.

# POLITICAL RESPONSES

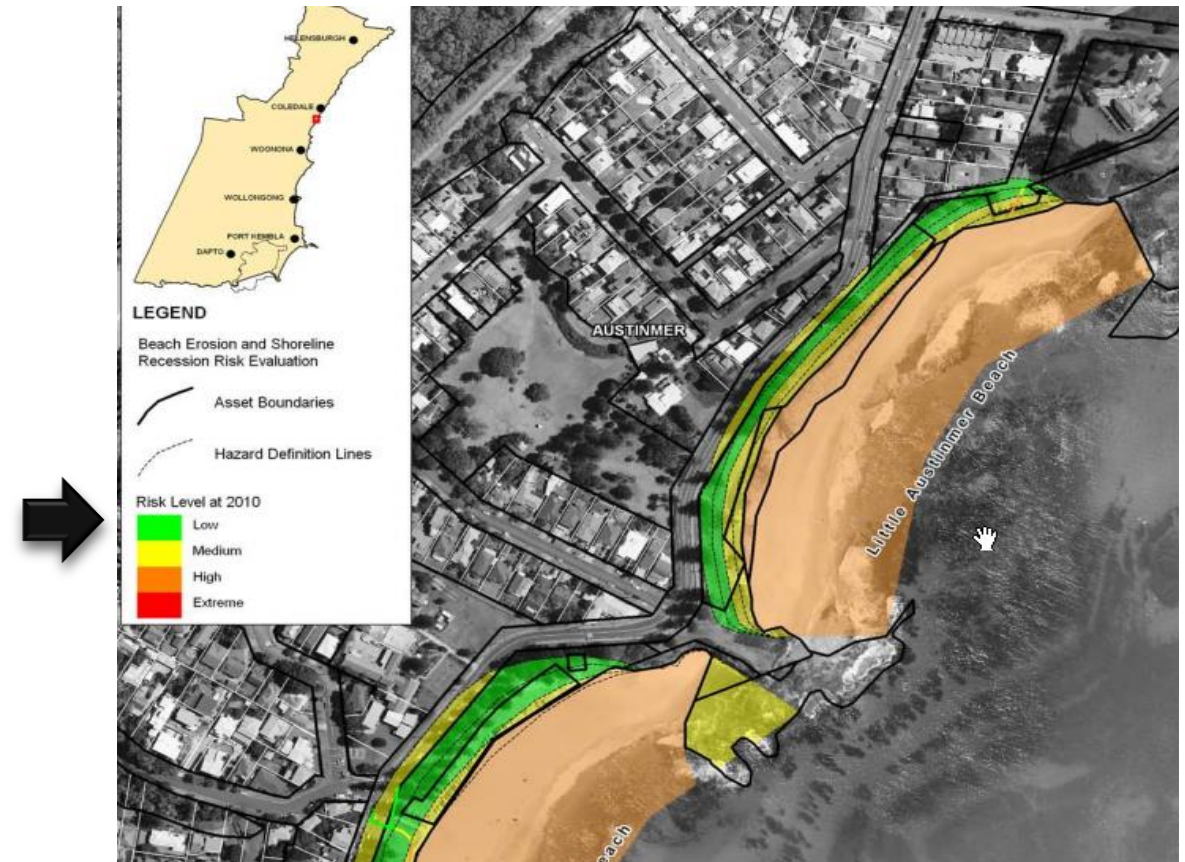

2011

2010

## UPDATE OF COUNCILS COASTAL MANAGEMENT PLANS

# SCIENTIFICALLY

## *Perceptions of Science*

*Remote, external, presuming superior knowledge, using strange language,*

*Little real life experience, dismissive of community knowledge, reluctant to engage with citizen science*

*Nice work if you can get it*

Commonwealth Science and  
Industrial Research  
Organisation

# THE COASTAL COLLABORATION CLUSTER

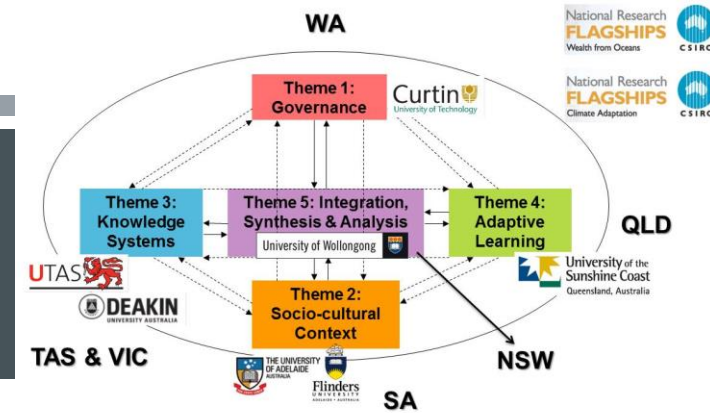

The **C**oastal **C**ollaboration **C**luster aimed to develop approaches to better **connect** science with the **needs** of governments, communities and industries to meet coastal challenges

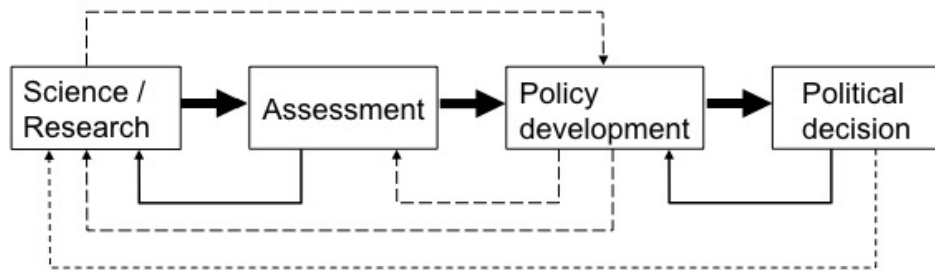

## A CSIRO FLAGSHIP SOCIAL RESEARCH PROJECT

- identify the key social and institutional **barriers** that inhibit the uptake of science in the coastal zone
- ways to introduce and apply the best **knowledge** available to coastal policy-making and planning

# KNOWLEDGE PATHWAYS

## Current paths to science impact

### Notes

Science information is normally on a one way trip as shown, with both feedback links and longer, indirect links being weak

The cumulative effects of transmission from science to policy is to weaken science impact

**What are the institutional and socio-cultural processes that lead to this information flow structure?**

### Information flow

- Strong / normative
- Weak / normative
- - - -> Weak
- - - - -> Very weak / absent

## More effective paths to science impact

### Notes

Science information is developed with stronger feedback from the policy and political domains in terms of defining information needs and policy impact

Stronger forward links such as research on properties of policy options

Feedback from Political domain on useability of science advice, but weak enough to inhibit political preferences from influencing science outcomes

**What are the institutional and socio-cultural processes that would create and/or strengthen these linkages?**

### Information flow

- Strong / normative
- Normative
- Useability

# GOVERNANCE AND COASTAL ADAPTATION UPTAKE

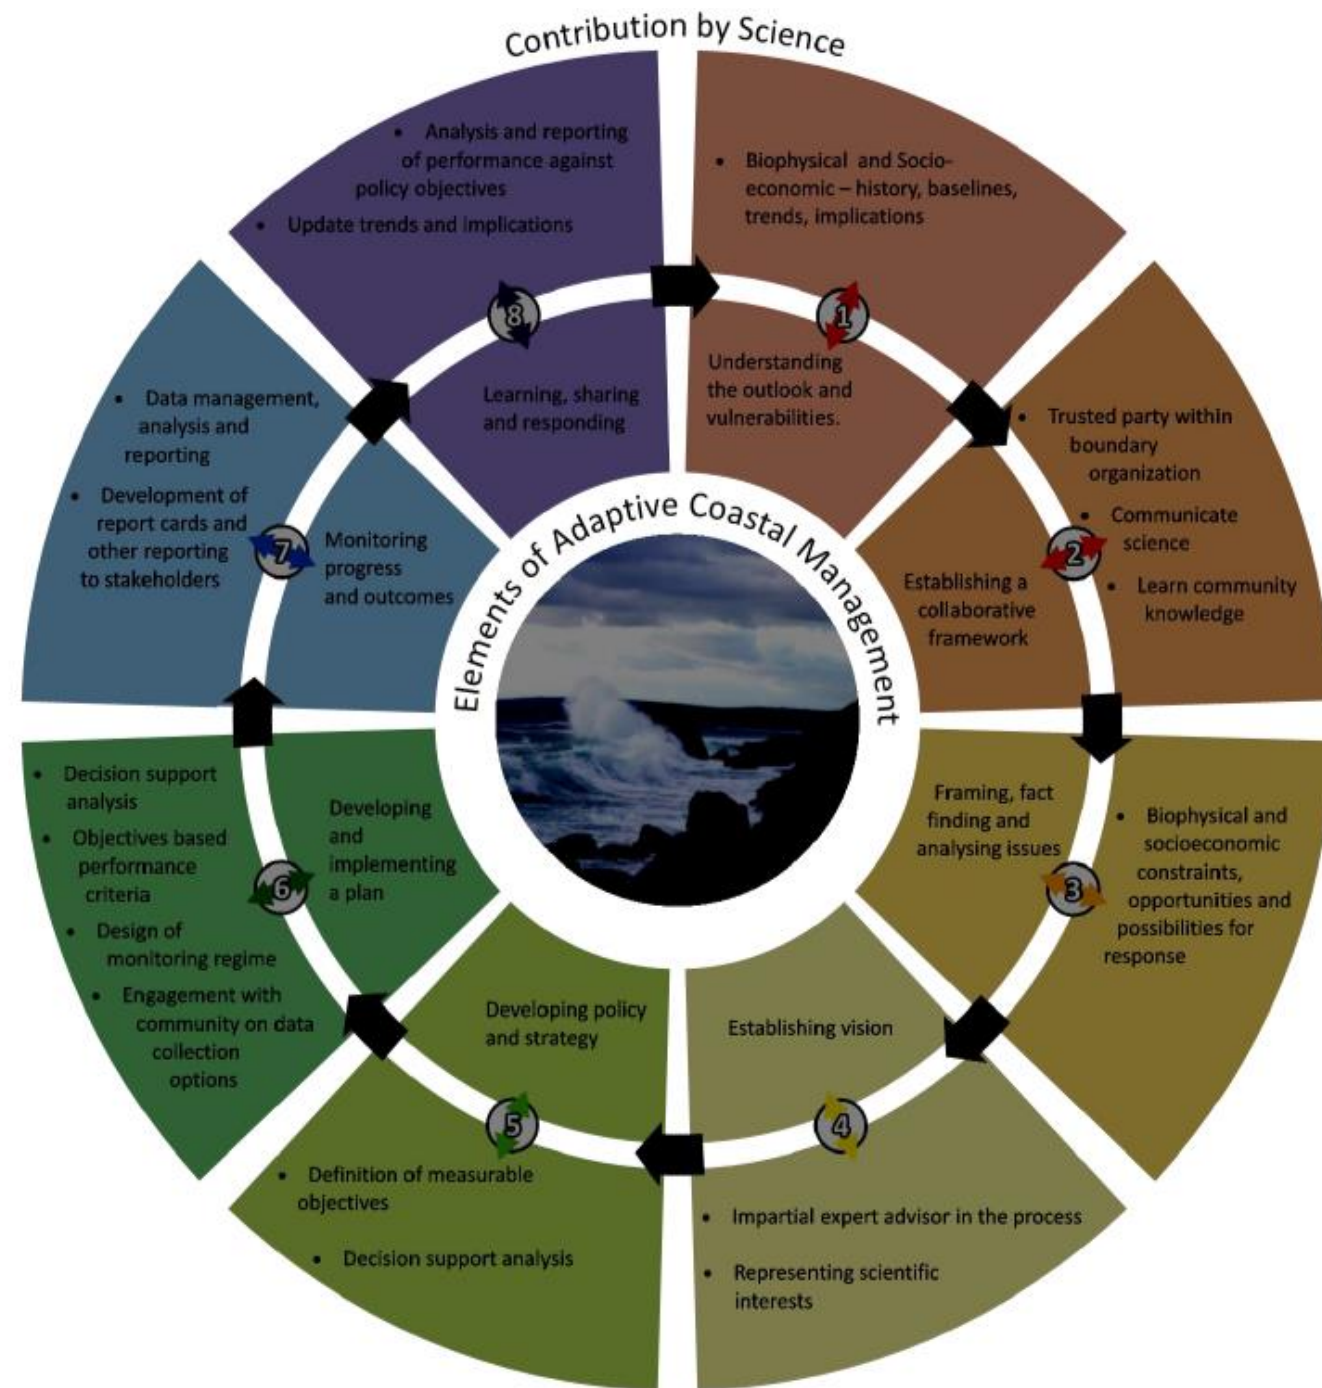

## CONTEXT – INCREASING CONTESTATION OF SCIENCE

Barriers	Key issues to be addressed
1. Clarity about data needed ( <i>needs of users</i> )	<ul style="list-style-type: none"><li>▪ Limited in-house capacity</li><li>▪ Inadequate engagement researchers / information users</li></ul>
2. Spatial-temporal scales ( <i>local relevance</i> )	<ul style="list-style-type: none"><li>▪ Periodic access or closure for particular uses</li><li>▪ Underlying processes of biophysical and socio-economic change in coastal areas are medium to long term in relation to most financial or political/electoral decision cycles</li></ul>
3. Information sharing ( <i>availability</i> )	<ul style="list-style-type: none"><li>▪ Available, but not understandable</li></ul>
4. Understanding the applicability of science ( <i>multiple purposes</i> )	<ul style="list-style-type: none"><li>▪ Biophysical science need to interact with cultural, social and economic values, attitudes and traditional knowledge</li></ul>
5. Uncertainty, risk and standards of proof ( <i>application</i> )	<ul style="list-style-type: none"><li>▪ Concepts of statistical confidence, addressing uncertainty in research design, and degrees of risk</li></ul>

# OPPORTUNITIES FOR SCIENCE ENGAGEMENT

The roles of sciences in the management and decision cycle

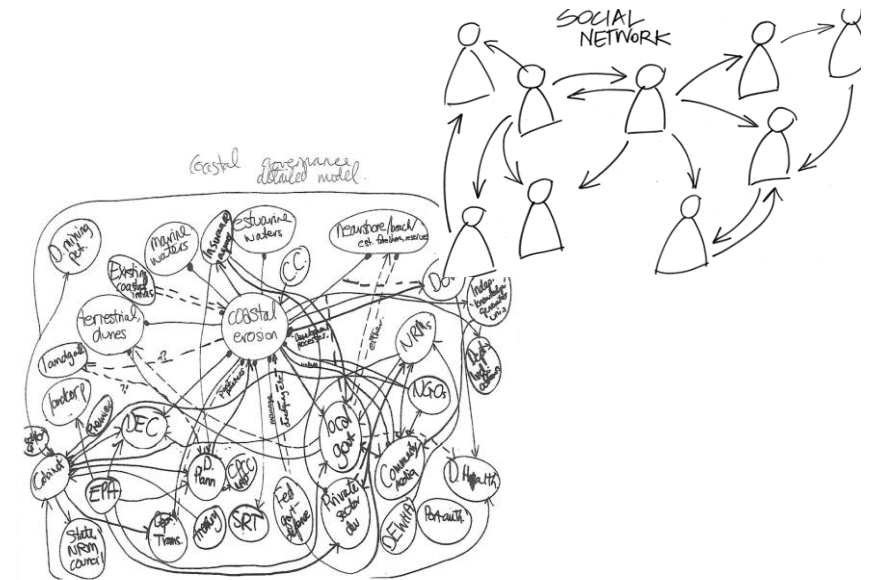

- Trusted, professionally independent advisor
- Contract provider of research services (e.g. peer review, scenario modelling, design/conducting of research)
- Sectoral stakeholder representing scientific interests and analysis

# PATHWAYS OF COASTAL ADAPTATION

## CHALLENGES OF INFORMING COMPLEX DECISIONS

1. BOUNDARY PROCESSES & ORGANISATIONS
2. SOCIAL NETWORKS
3. COASTAL CHAMPIONS

# BOUNDARY PROCESS AND ORGANIZATIONS

## TACTICAL PROBLEM SOLVING APPROACH

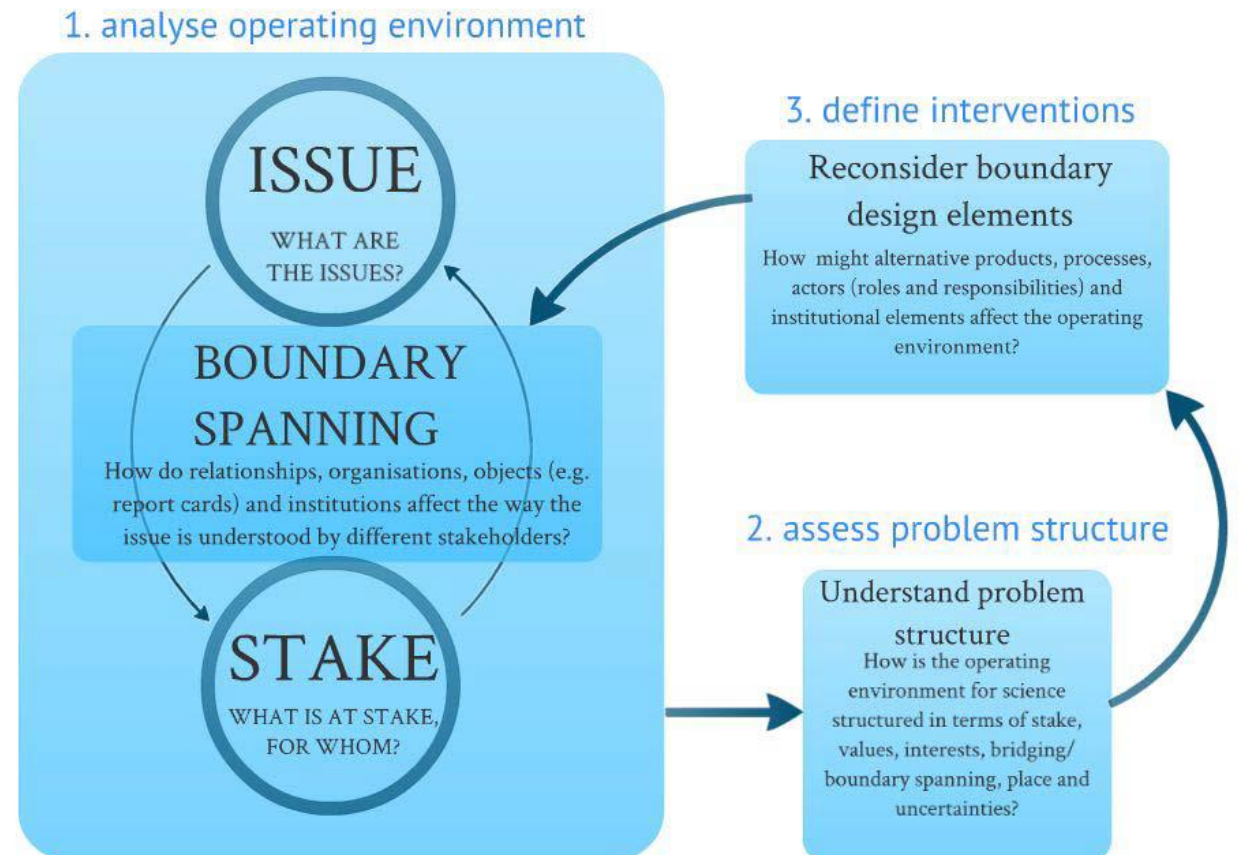

Conceptual model for improving the uptake of science

Forums for such engagement in knowledge sharing, development and application

Natural Resource Management (NRM) boards (FORMAL)  
Community groups (INFORMAL)

(Coffey and O'Toole 2012; O'Toole et al. 2013)

# SOCIAL NETWORKS

SNA seeks to explain how social interaction is conditioned by the patterns of connection between people (actors).

1. high betweenness centrality → gatekeepers / brokers
2. mapping coastal networks and then connecting with central actors → facilitate the distribution of information
3. Identifying actors for inclusion in ‘boundary spanning’ projects

# COASTAL CHAMPIONS

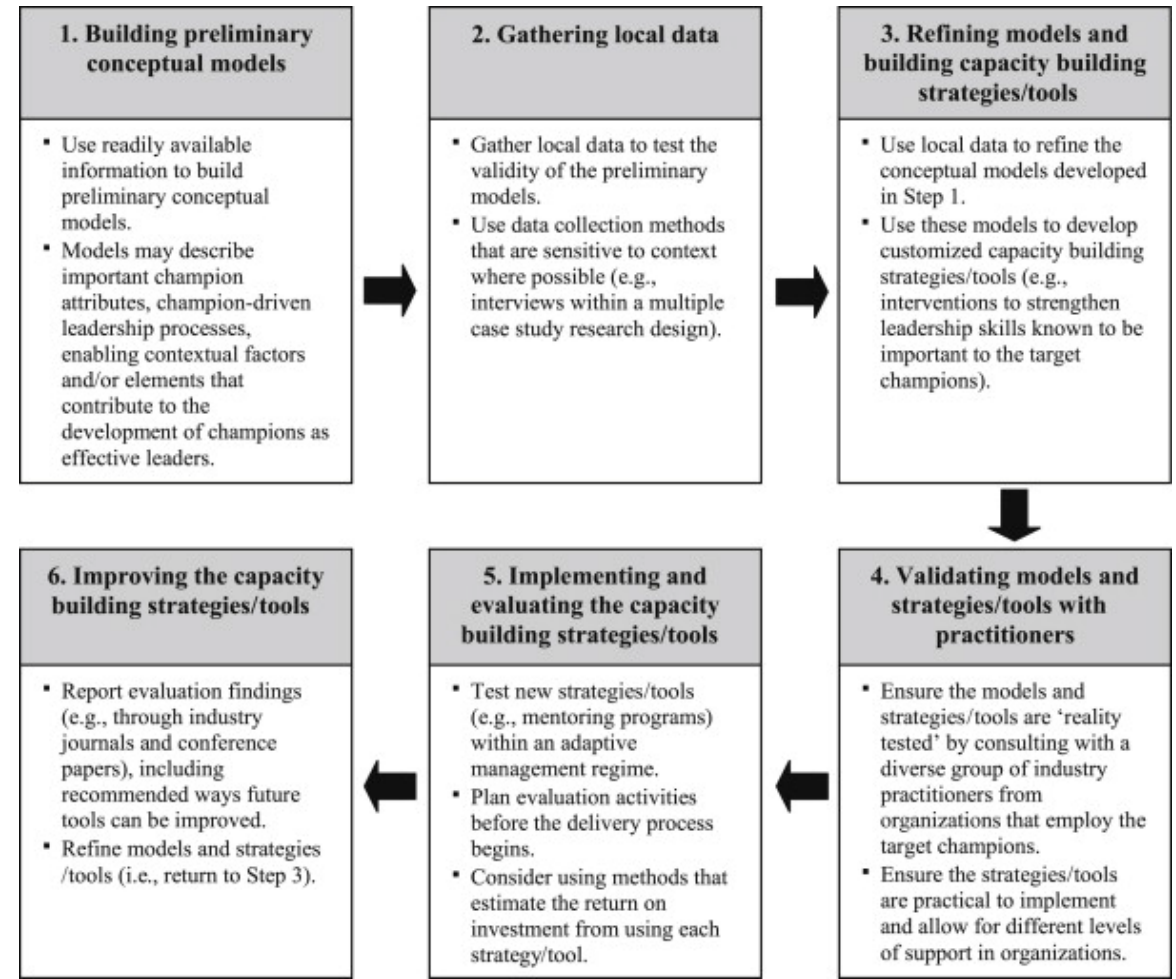

## Key characteristics of coastal champions

1. Effective communicator
2. Extensive knowledge
3. Effective Networker
4. Passionate
5. Persistent
6. Credible
7. Longevity
8. Friendly
9. Committed
10. Enthusiastic
11. Hard Working
12. Selfless
13. Innovative
14. Determined

(Mumford's 2012; Taylor et al 2012)

## FOSTERING COASTAL CHAMPIONS

# COASTAL CHAMPIONS - NETWORKS

Major strategies of science uptake into Australian coastal policy

## SUCCESSFUL INFLUENCERS OF SCIENCE UPTAKE

- Maintain integrity and credibility
- Be persistent
- Understand different motivations and views

- Build and maintain relationships
- Disseminate information
- Communicate effectively

- Identify and attend forums for developing relationships
- Communicate indirectly - through the media
- Communicate widely - publish in journals with wide readerships, multi-disciplinary conferences

<http://coastalcluster.org.au/node/271>

In Nyungar Cosmology, the Waakal is the Creator, the keeper of the fresh water sources. He gave us life and our trilogy of belief in the *boodjar* – the land – as our mother and nurturer of the Nyungar *moort* – family and relations – and our *katitjin* – knowledge so that we could weave that intricate tapestry known as the “web of life”.

## IN CONCLUSION

- **Conventional systems** of government have not been very successful in resolving coastal management problems.
  - lack of progress is partially attributable to inadequate representation in governance processes of the variety of knowledges present on the coast.
- Current approaches to **coastal adaptation planning** are likely to be beset by:
  - complex processes and uncertain understandings;
  - diverse forms of legitimate knowledge / multiple sources of fragmented information;
  - constrained /conflicting and planning horizons and timeframes;
  - sensitivities regarding the release of information;
  - the sense that coastal adaptation is political.

# IN CONCLUSION

- **Scientific knowledge** is central to good governance, providing key information about environmental changes and adaptation, increasing stakeholder awareness of the impacts of climate change and building effective action.
- **Knowledge** - consisting primarily of scientific knowledge, but also of managerial, lay and Indigenous knowledge
- It has to be **adaptive** and deal with temporal scale challenges:
  - Biophysical – change medium to long term \_generational
  - Socioeconomic – change short to long term \_decadal
  - Political – short term – fig leaf? 1-4yrs
  - Catastrophic – instantaneous

THANK YOU!

OBRIGADO!
