

*Effects of Climate Change on the World's Oceans*

# Biodiversity consequences of climate change in the deep ocean

Lisa A. Levin

Center for Marine Biodiversity and Conservation  
Scripps Institution of Oceanography, UC San Diego, USA

March 25, 2015  
Santos City, Brazil

50 years ago ...

This generation has altered the composition of the atmosphere on a global scale through radioactive materials and a steady increase in carbon dioxide from the burning of fossil fuels.

- President Lyndon B. Johnson, 1965

50 year later....

This generation has begun to alter the deep ocean...  
Via CO<sub>2</sub>-induced environmental change and resource exploitation

# Delving Deeper

- Special Features of the Deep
- Climate Change (T, OA, O<sub>2</sub>) in Deep water
- Biodiversity Consequences
  - Past: Paleooceanographic lessons
  - Present: Learning from natural gradients
  - Future: Projection and Adaptation

# The largest habitat on earth

- The deep ocean (>200 m) comprises 2/3 of the planet's surface area and > 90% of its habitable volume
- We have seen < 5% of the deep sea floor thus most marine species are undescribed.
- Great depth limits access & measurement capability

# Special Features of the Deep Sea

(that influence biodiversity and its response to changing environments)

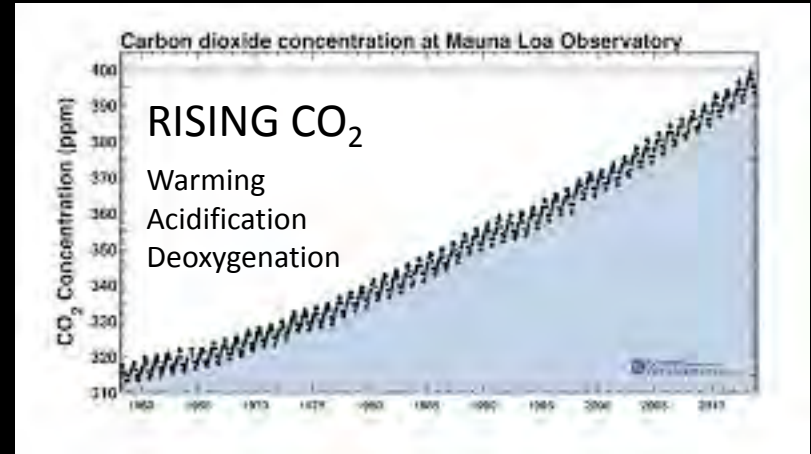

- **Vast areas** - impossible to catalogue all biodiversity
- **Remote and far from shore** = high exploration & exploitation costs (=Protection!)
- **Technology-limited** advances in knowledge & exploitation (we lack full-ocean depth capability for a host of measurements)
- **Heterogeneity** of habitats and time/space scales ( translates to variable response to climate change)

# Special Features of the Deep Sea cont.

- **Slow processes:**
  - long-lived species, low replacement rates
  - long time lag between biodiversity response and receipt of services by humans
- **Lack of scientific knowledge** -many unknown unknowns adds to uncertainty
- **Lack of public awareness**
- **Growing human influence**

# New exploration tools reveal a wealth of environmental heterogeneity

SEABED SONAR MAPPING FROM RRS JAMES CLARKE ROSS

As the ship passes over a survey area, broadband acoustic beams fan out to wide swathes of the water column and seabed. It takes many passes to produce a continuous set of images.

Images formed off the seabed and water column are always the same size and shape as the area they are recorded.

## MULTI BEAM SONAR

Deep Argo

# Warming to $> 1.4^{\circ}\text{C}$ has allowed a Lithodid Crab invasion In the Palmer Deep, Antarctica

# Warming may dissociate gas hydrates, pervasive throughout the margins and expand seep ecosystems

The greatest warming is also subject to most intense bottom trawling

Temperature stress may reduced resilience and recovery from disturbance

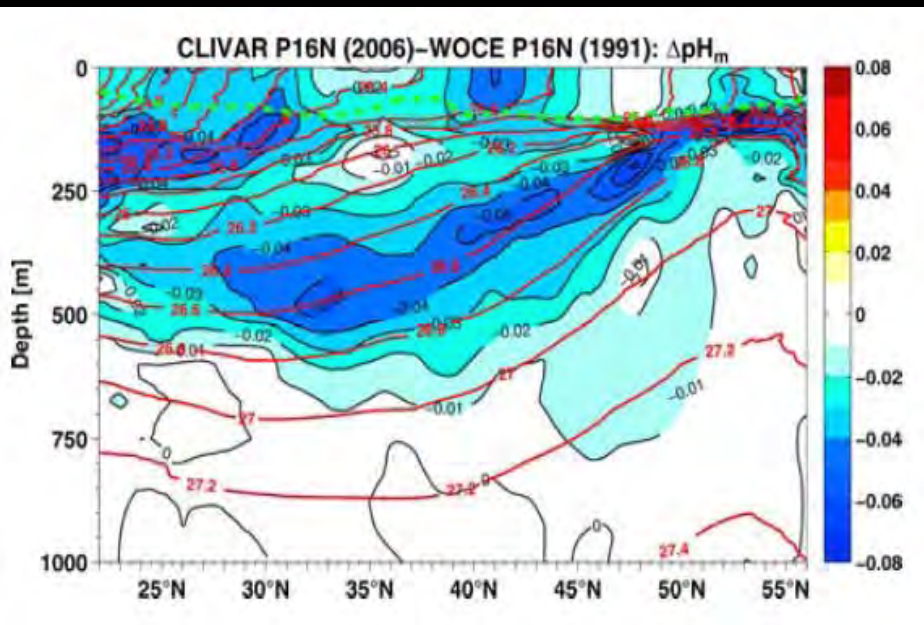

# pH Changes

## North Pacific

Total pH Change (1991-2006)

Atmospheric  $\text{CO}_2$  + respiration

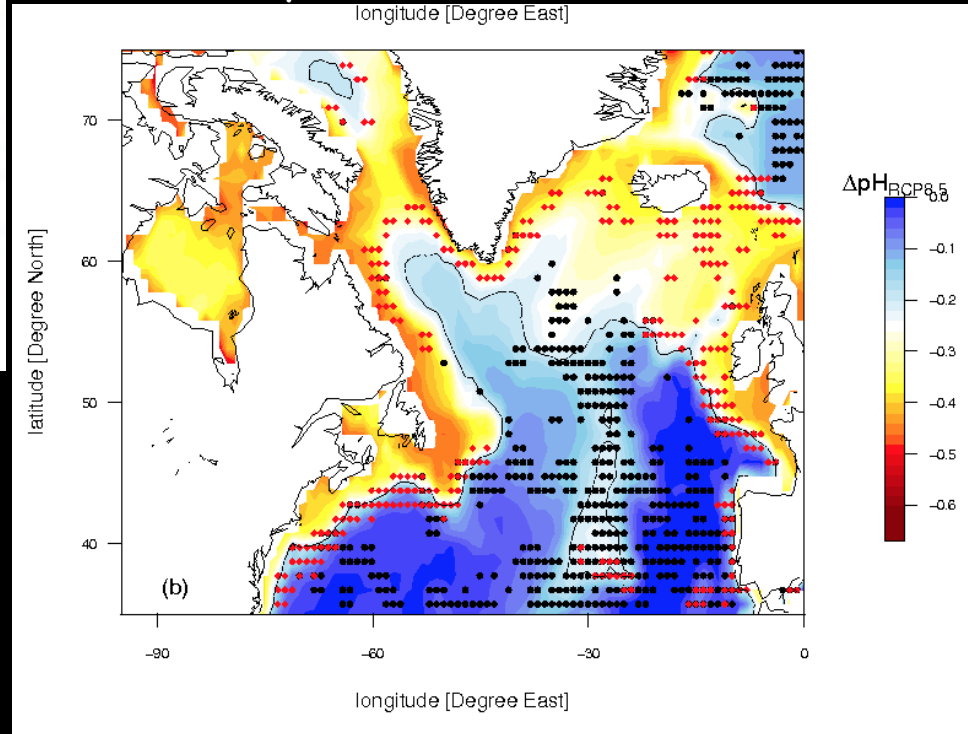

Byrne et al. 2010

17-21% of N. Atlantic seafloor  
> 500 m will experience a  
0.2 unit drop in pH by 2100.

## North Atlantic

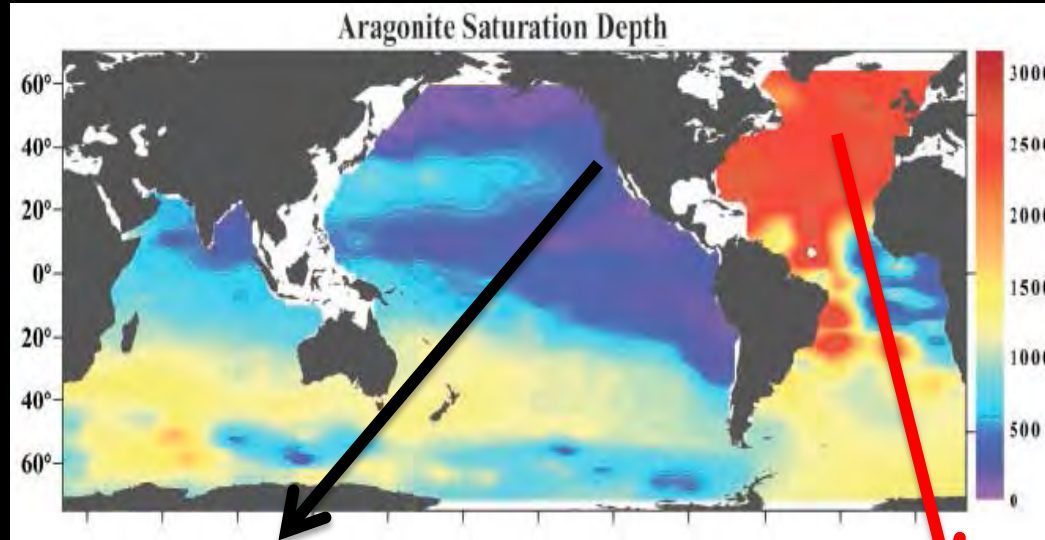

Deepwater formation draws down  
high- $\text{CO}_2$  water with transport by  
boundary currents.

Gehlen et al. 2015

# Differences in aragonite saturation between ocean basins affect deep-water calcifiers.

$$\Omega_{\text{arag}} = \frac{[\text{Ca}^{2+}][\text{CO}_3^{2-}]}{K_{\text{sp}}}$$

Threshold at 0.16 ml/l  
( $7\mu\text{M}$ )

0.5 ml/l ( $22\mu\text{M}$ )

Temperature ( $^{\circ}\text{C}$ )

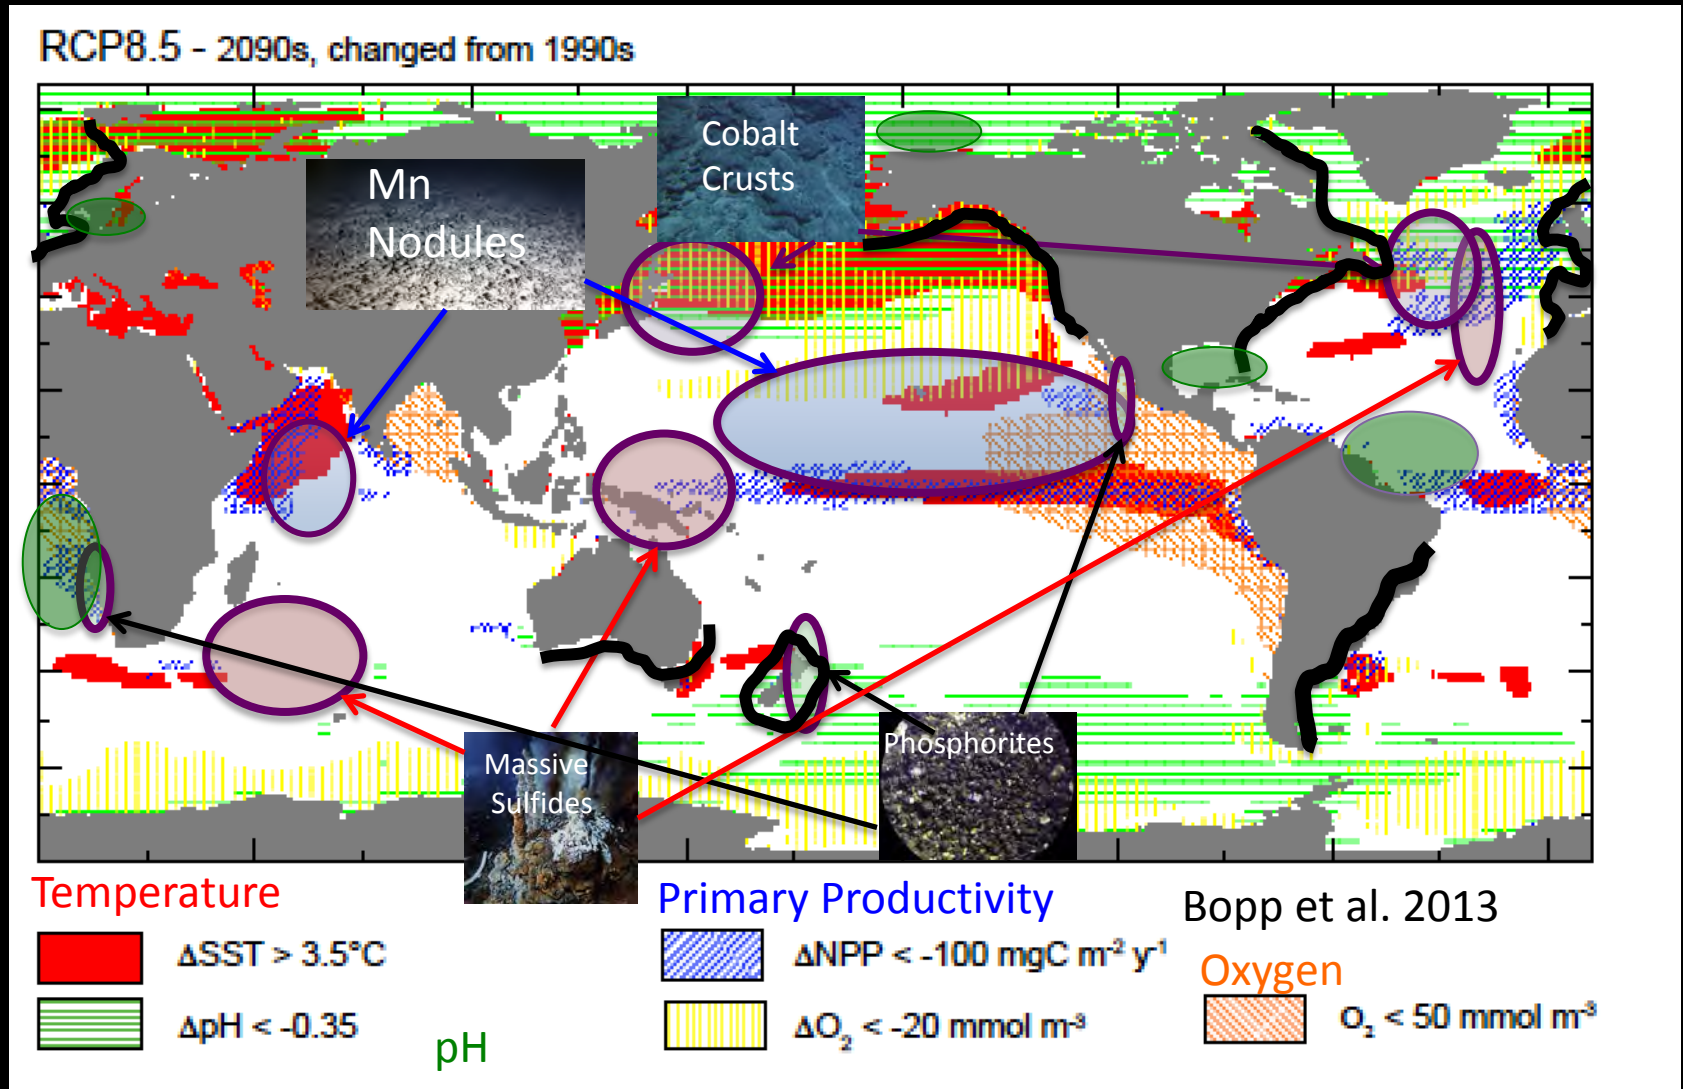

Threshold at  $900\mu\text{atm}$

# RESULTS REMOVED

- UNPUBLISHED DATA

The greatest threats to deep-sea biodiversity will come from the intersection of climate change with direct human activities

Fishing, Energy, Mining Resource Extraction

# Back to Biodiversity

- Deep-sea biodiversity is sensitive to warming, acidification and deoxygenation, but also holds key to future adaptation.
- Recognize climate change as a cumulative impact - with interactions among stressors and with direct human activities in the deep ocean.
- Initiate a global 'deep' observing network targeting ecosystems and regions at the nexus of climate change and deep-sea industrialization.
  - Argo, moorings, observatories, exploration, biodiversity
  - (Deep-Ocean Observing System)
- Incorporate climate change into environmental planning in the deep sea.
