

# **Reviews of albacore biology and fisheries around the transition areas in the north Pacific Ocean**

**Yoshinori Aoki, Ko Fujioka and Hidetada Kiyofuji**

# Growth and Maturity of albacore tuna

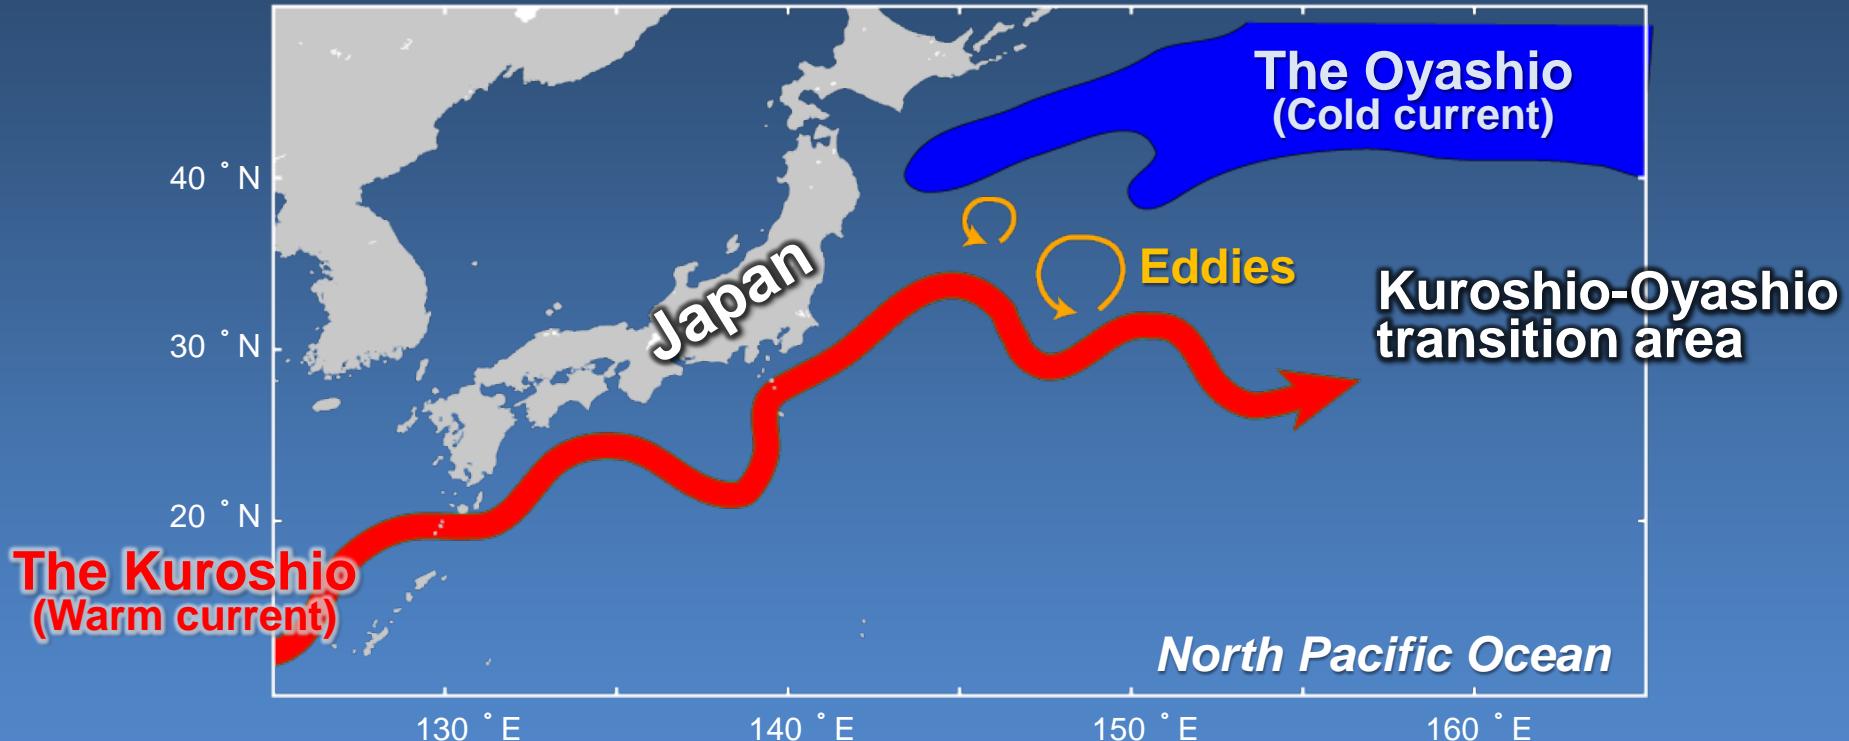

# Albacore migration in the north Pacific Ocean

Nikolic *et al.* 2017

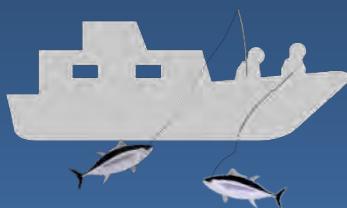

# Transition area in the north Pacific Ocean

## Objective

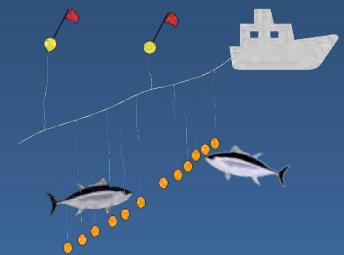

To overview the impact of the transition area on the albacore behavior and distribution

# Albacore catch around Japan

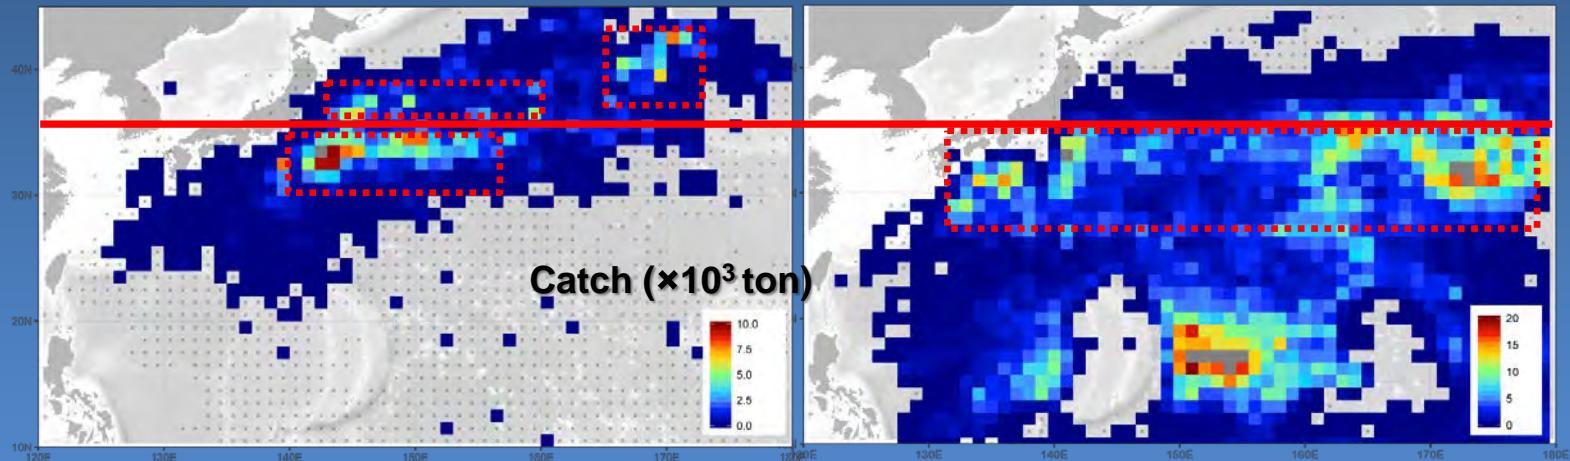

Japanese pole & line  
Logbook (2000-2017)

Japanese long line  
Logbook (2000-2016)

35°N

Long line catch decrease in the northern area ( $>35N$ )

# Research areas

30 ° N

20 ° N

130 ° E

140 ° E

150 ° E

April to March in 2002 and 2004

Recaptured individuals

Fork length : 71, 74, 77, 78 cm

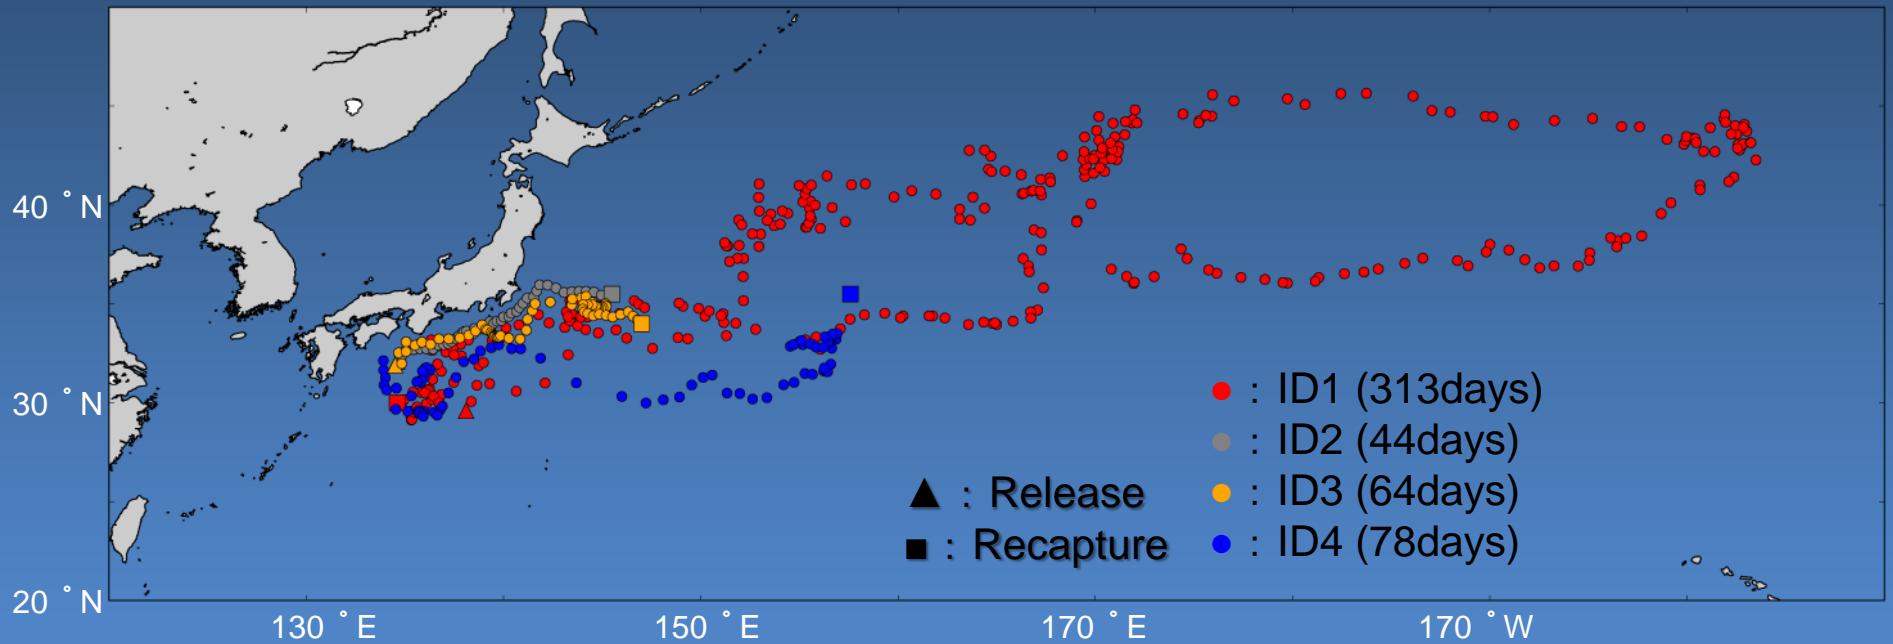

Data interval: 512 seconds

Swimming depth  
Water temp.  
Body temp.  
Light intensity  
(Geolocation)

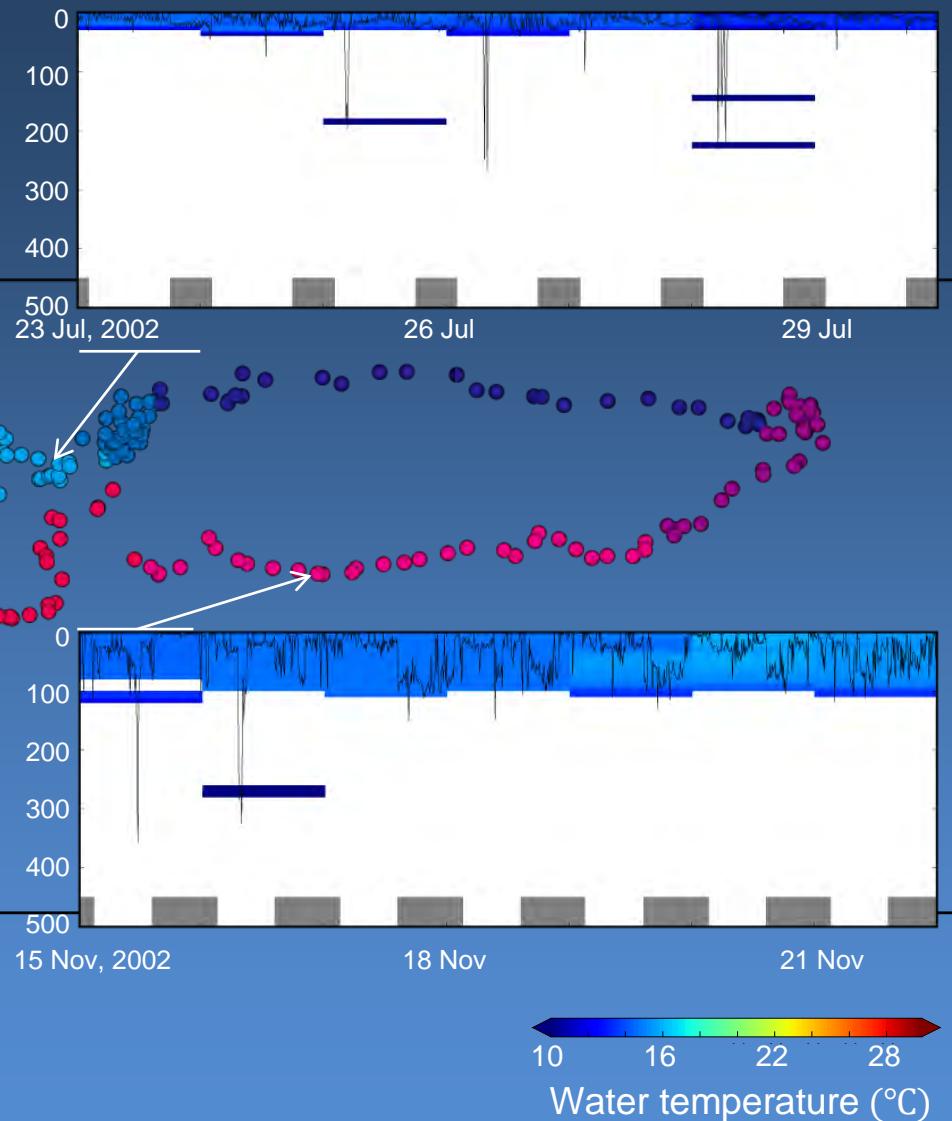

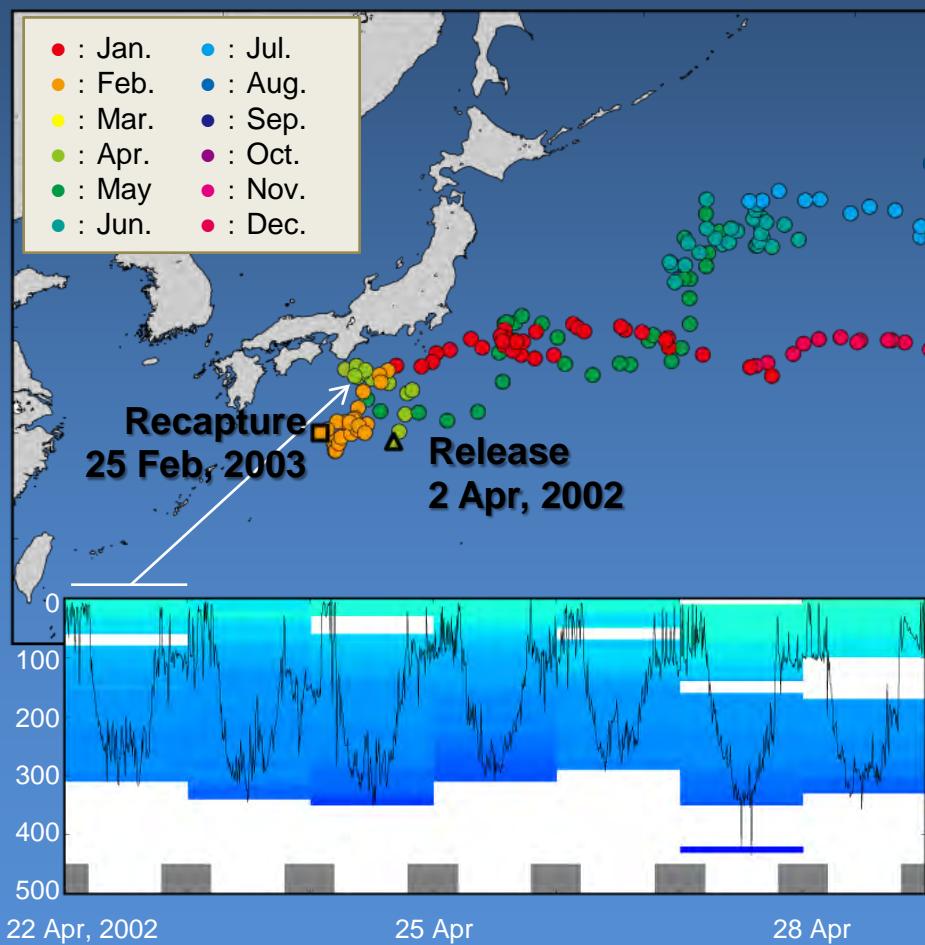

Hokimoto and Kiyofuji, 2014;  
Kiyofuji et al. 2013 (ISC/13/ALBWG-03/04)

## Recovered 4 tracks from tags

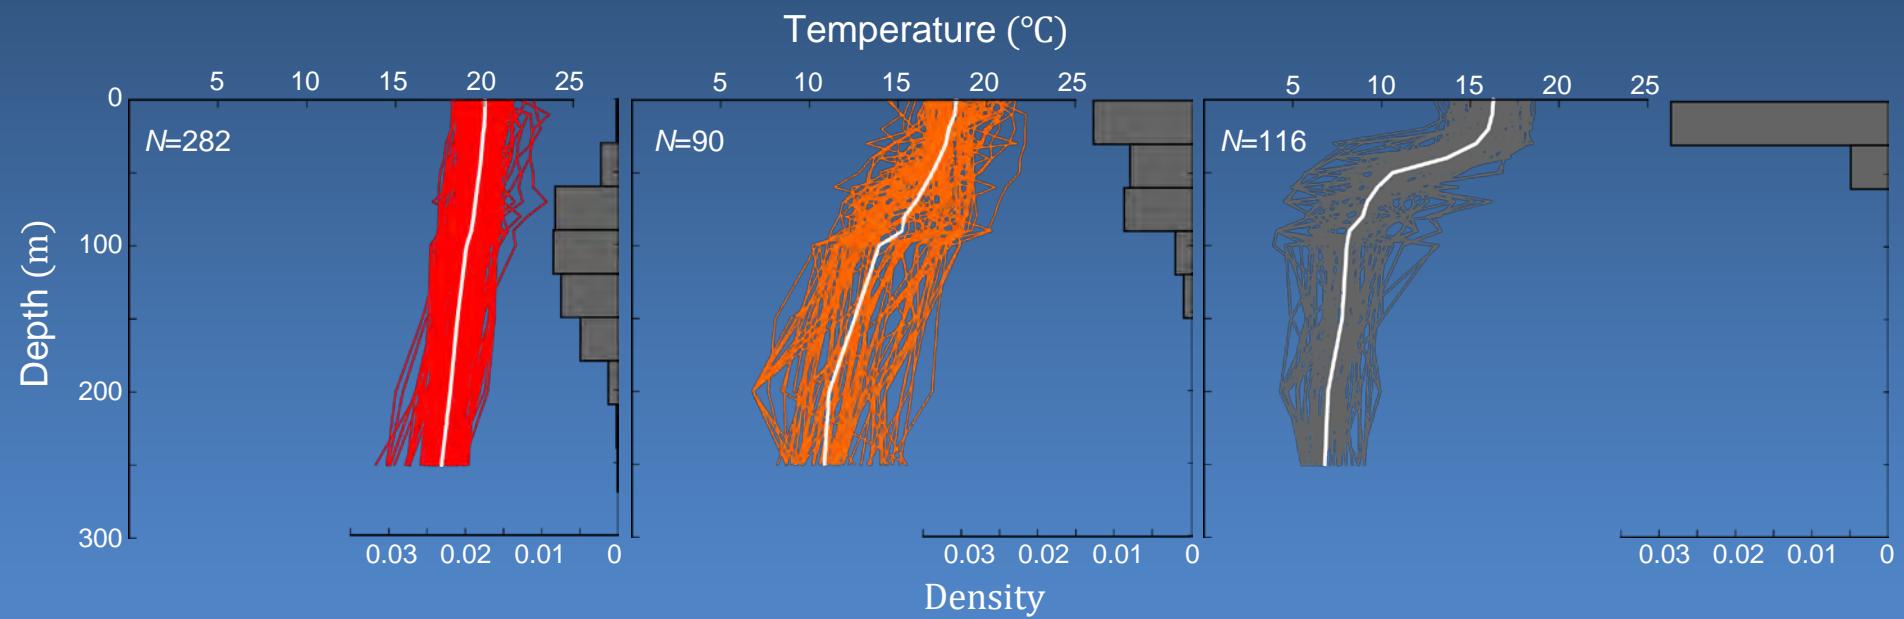

All individuals move to eastward after release

# Example of individual 1

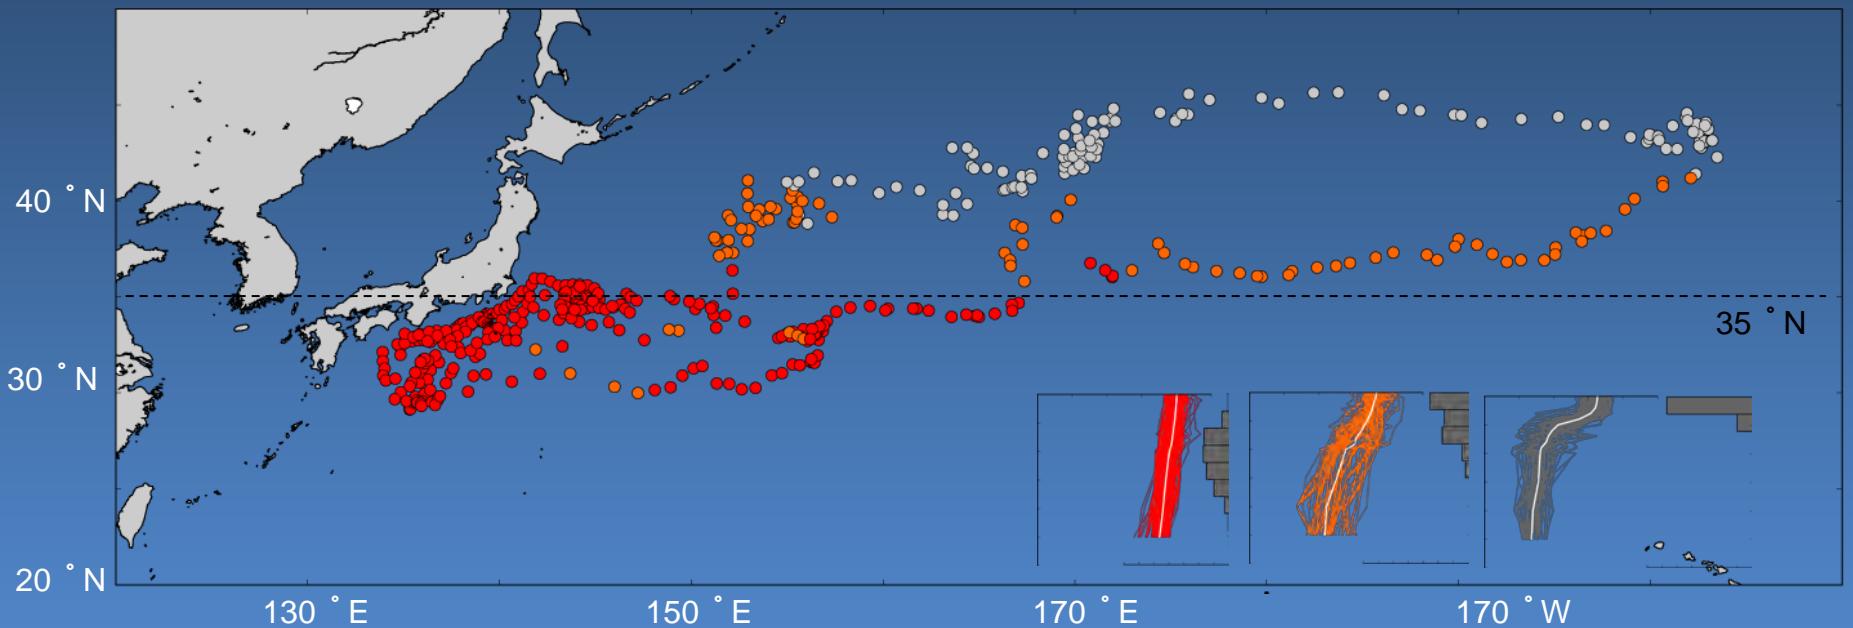

# Habitats based on thermal environment

ALB widely distribute in the mixed layer, while they stay at the surface in the strong thermocline

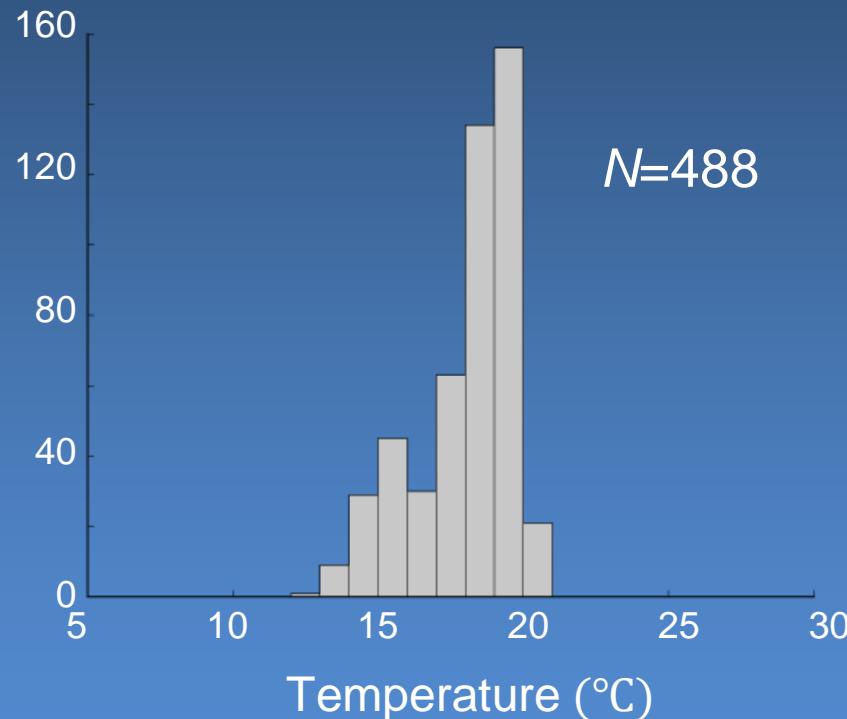

# Classified habitat positions

Distinct depth change around the transition area

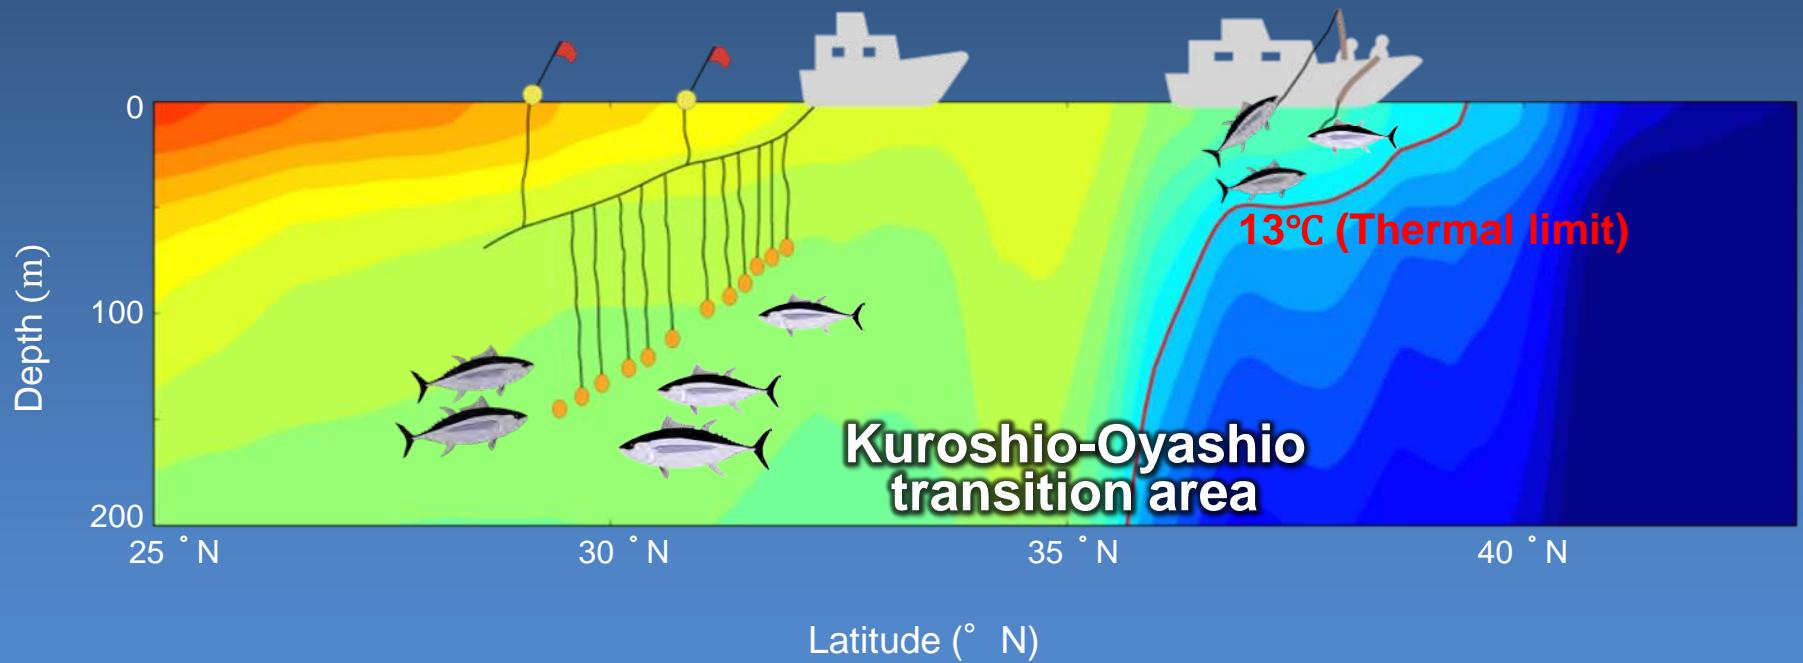

# Daily averaged temperature

Min: 12.9°C, Mean: 18.0°C, Max: 20.9°C

The lower thermal limit is about 13°C

# Interactive between the fish and fisheries

# Conclusion

We investigated juvenile albacore distribution in the north western Pacific ocean by using archival tag

Tagged albacore exhibit depth change related to water column:  
In well mixed layer, they widely distributed in the layer, while  
they stayed at the surface in the strong thermocline

⇒ Distribution constraints may be linked to the fishery efficiency  
as it changes interaction depth of the fish and fisheries

*Thank you for your attentions*
