Ecopath with Ecosim

- *Software system*
- *Open source-code (SVN access)*
- *Freely available (GNU GPL)*
- *www.ecopath.org*

Ecopath: Mass-balance book-keeping

Ecosim: Time-dynamics, policy exploration, MSE, ...

Ecospace: Spatial- and time-dynamics

Ecotracer: Tracking persistent pollutants

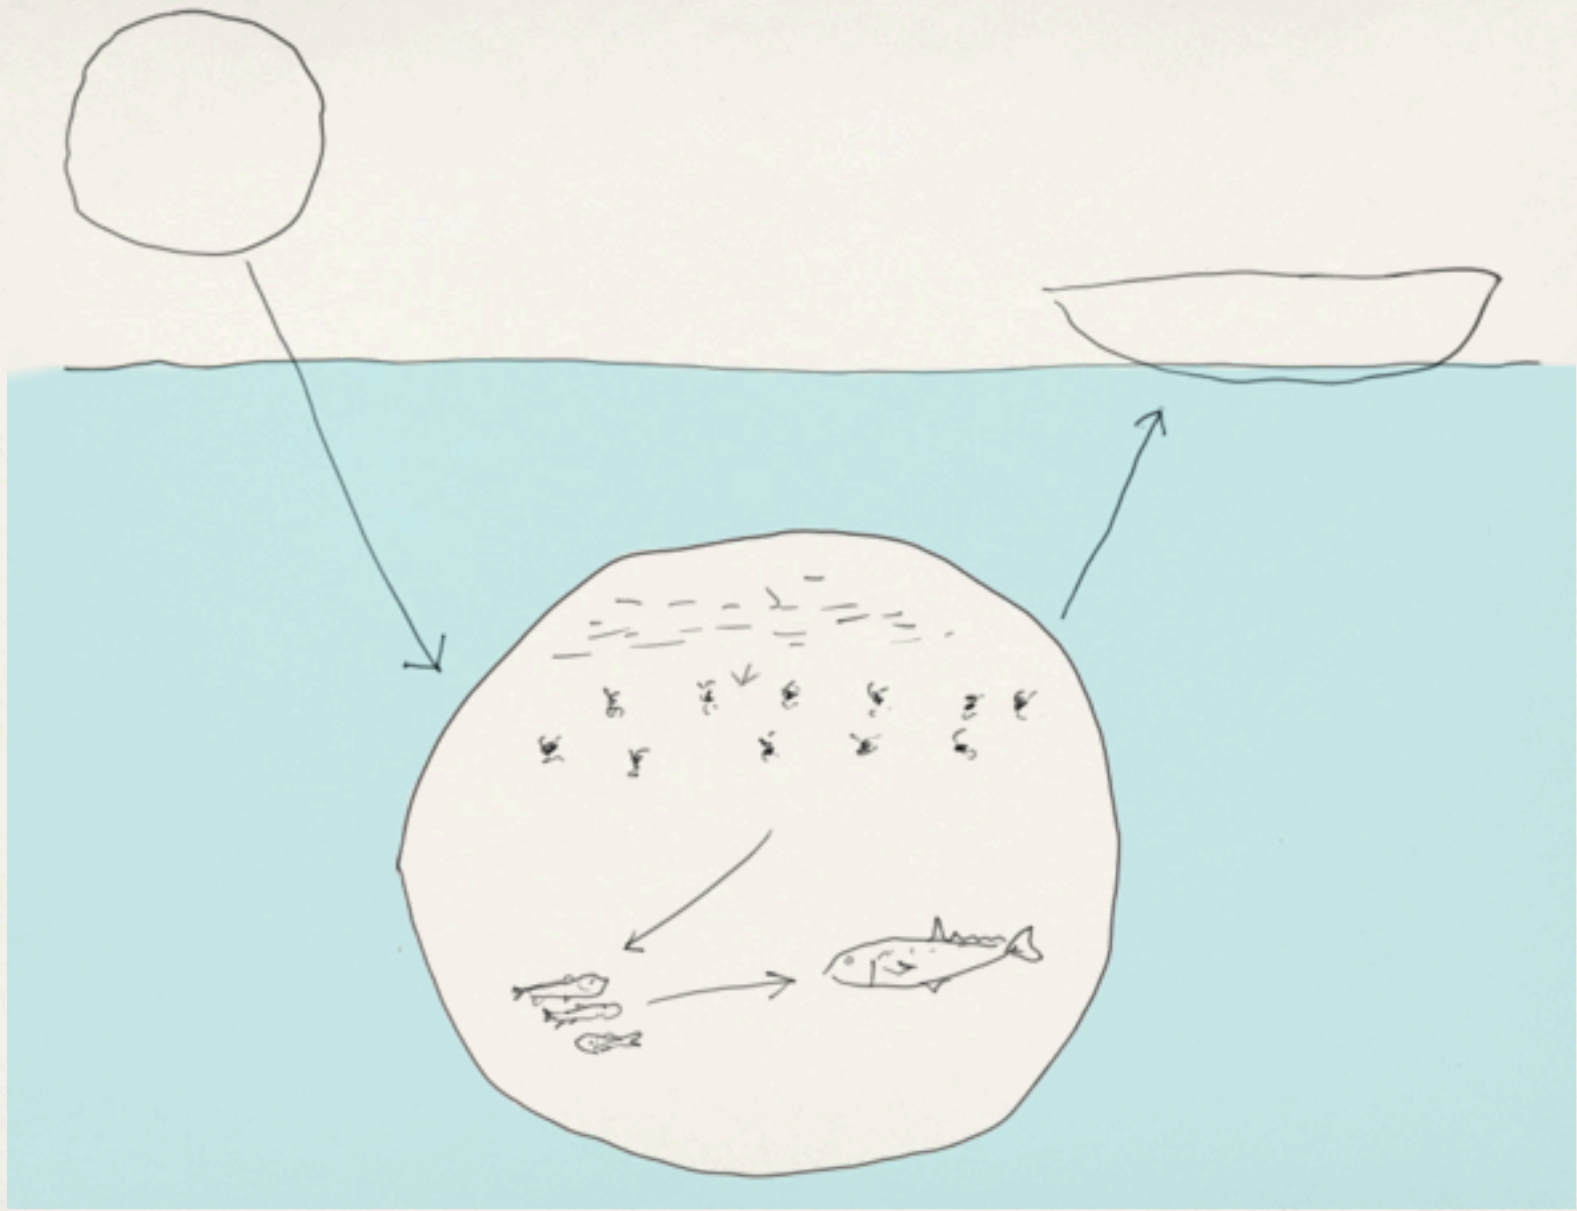

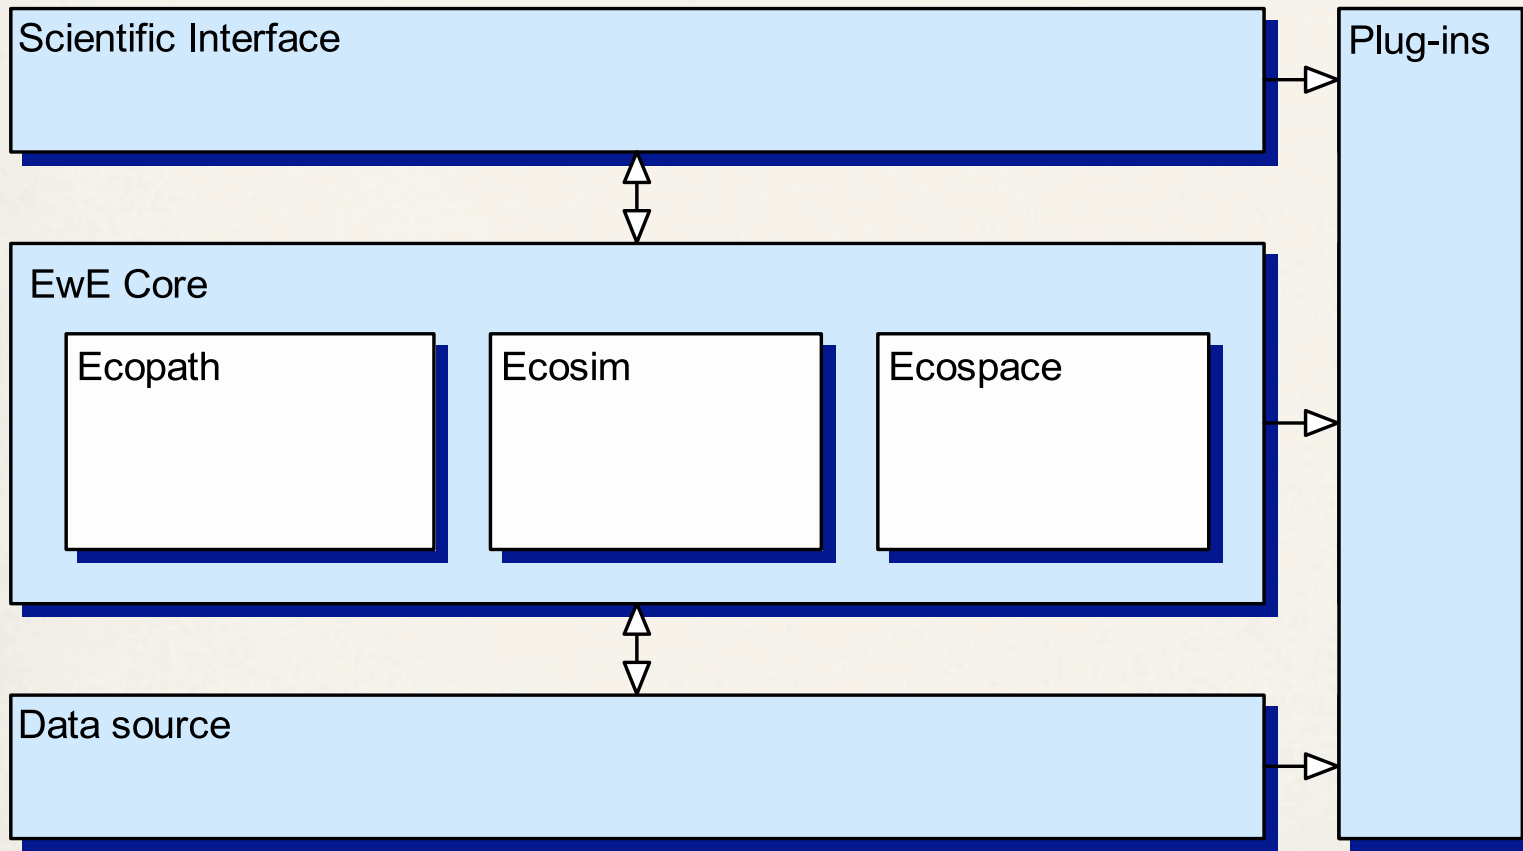

Ecopath models fitted to time series data

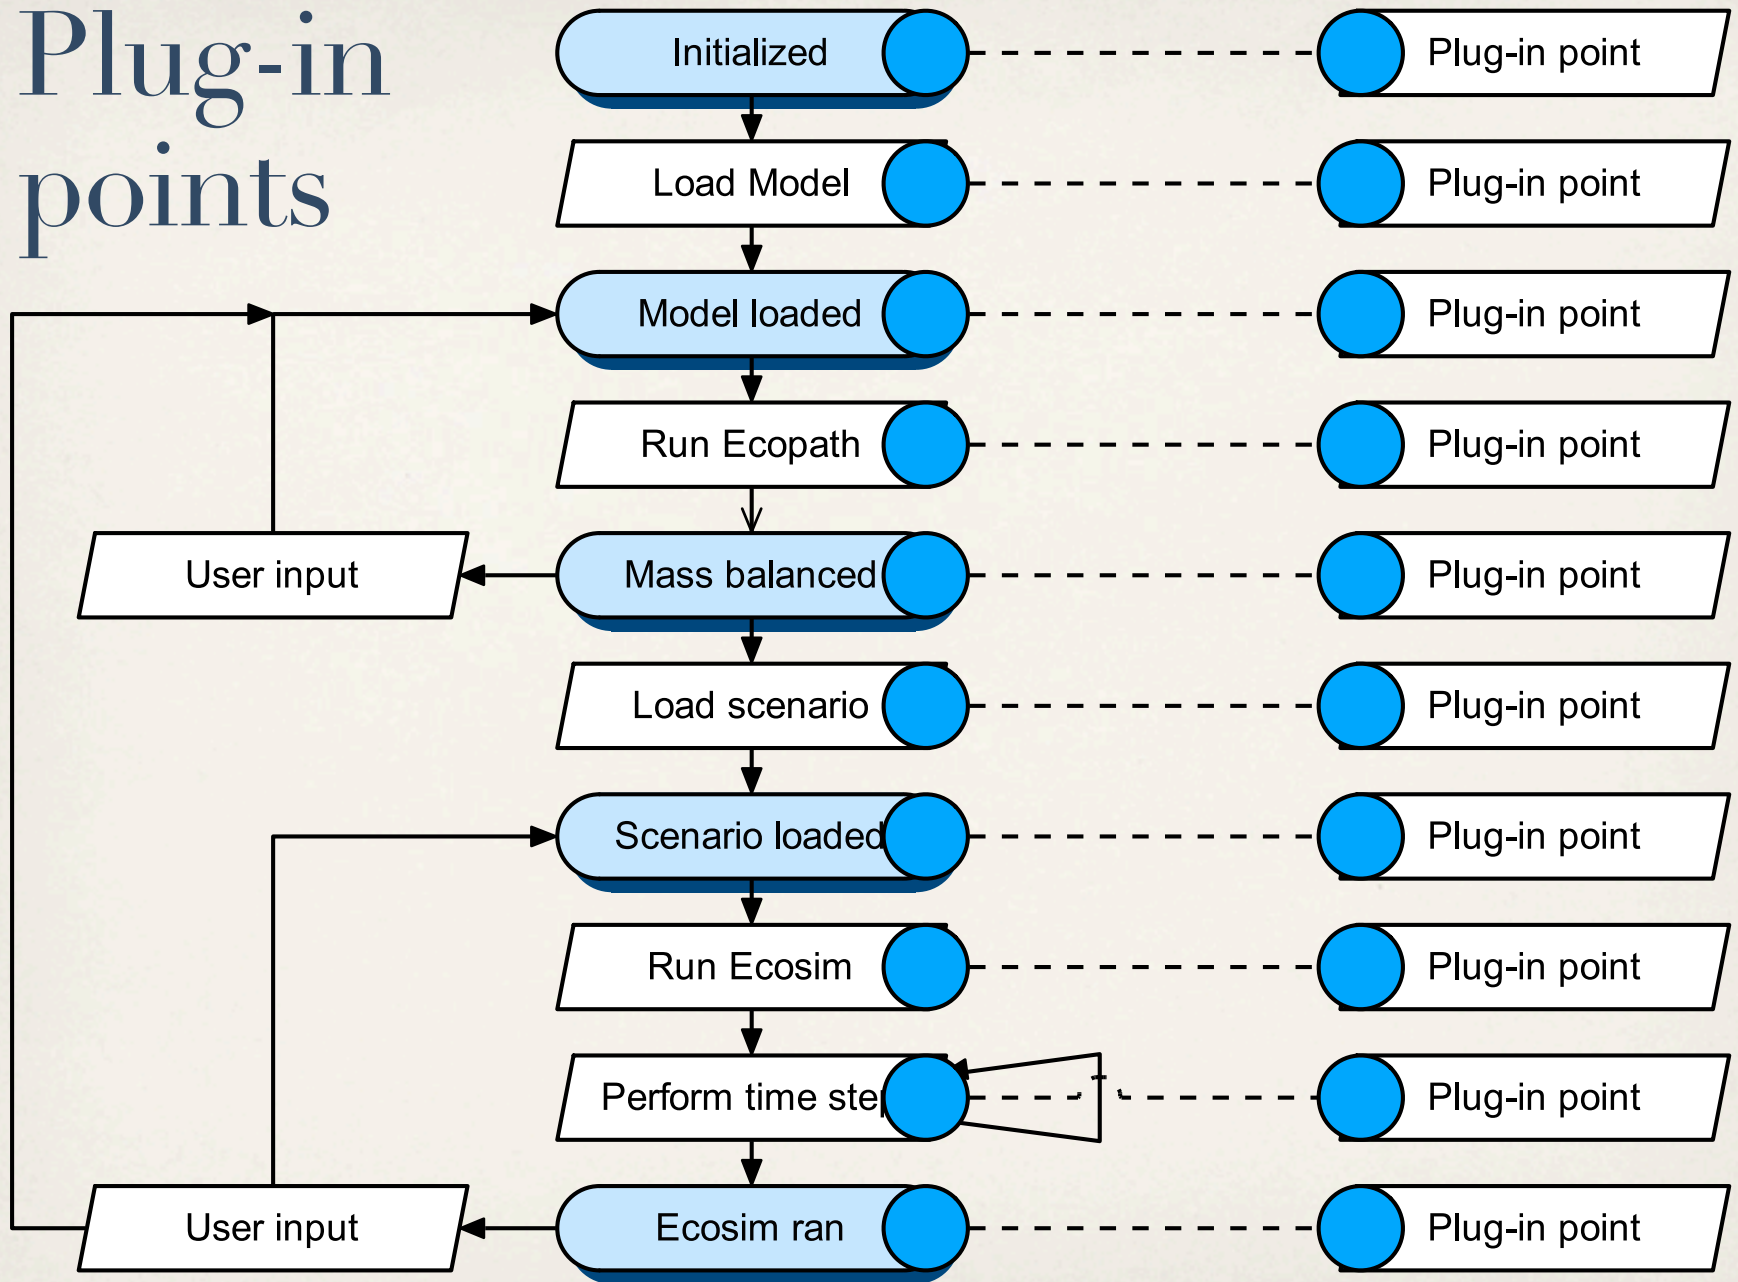

EwE6 overview

Plug-in points

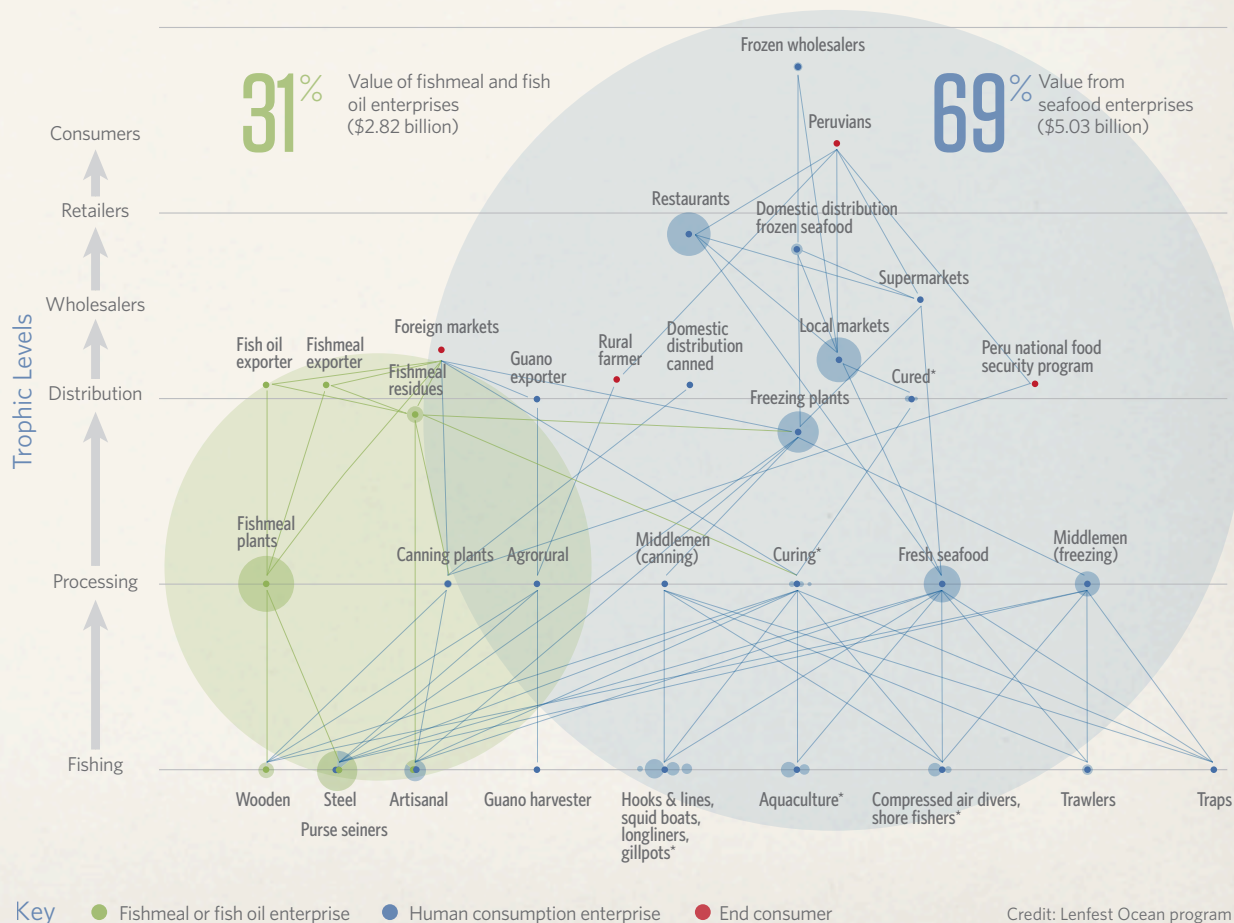

EwE modules/plug-ins

- Value chain, UBC
- Results-extractor (CEFAS)
- Management Strategy Evaluation implementation (CEFAS)
- Temporal-spatial dynamic data (UBC)
- EcoTroph (Agrocampus Ovest)
- Biodiversity indicators (CSIC-ICM)
- Network analysis, (SAMS)
- Network analysis - R (SAMS)
- Multi-Sim (DFO)
- Flow diagram (UBC)
- Ecopath model from Ecosim run (CSIC-ICM, CSIRO, DFO)
- Remarks extractor (UBC)
- Reading of GIS shape files*
- Dynamic habitat modification, (UBC)*
- FishBase taxon search*
- WoRMS taxon search*
- Sea Around Us search*
- Database-derived basemaps*
- ...

Value chain: Peru's fishing sector

- Bottom-up quantification
- Has world's biggest single-species fishery, for anchoveta
- But 69% of revenue and 87% of sector employment in Peru is from human consumption

Productivity

Climate & currents

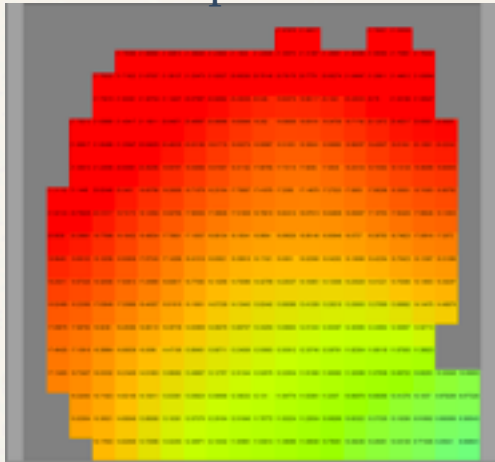

Habitat capacity modeling in EwE

- Dynamic habitat model predicts how productive individual cells are for each species
- Spatial cells have properties for different habitat types, e.g., %hard bottom

Habitat capacity: environmental maps

Temperature

Reef area

Salinity

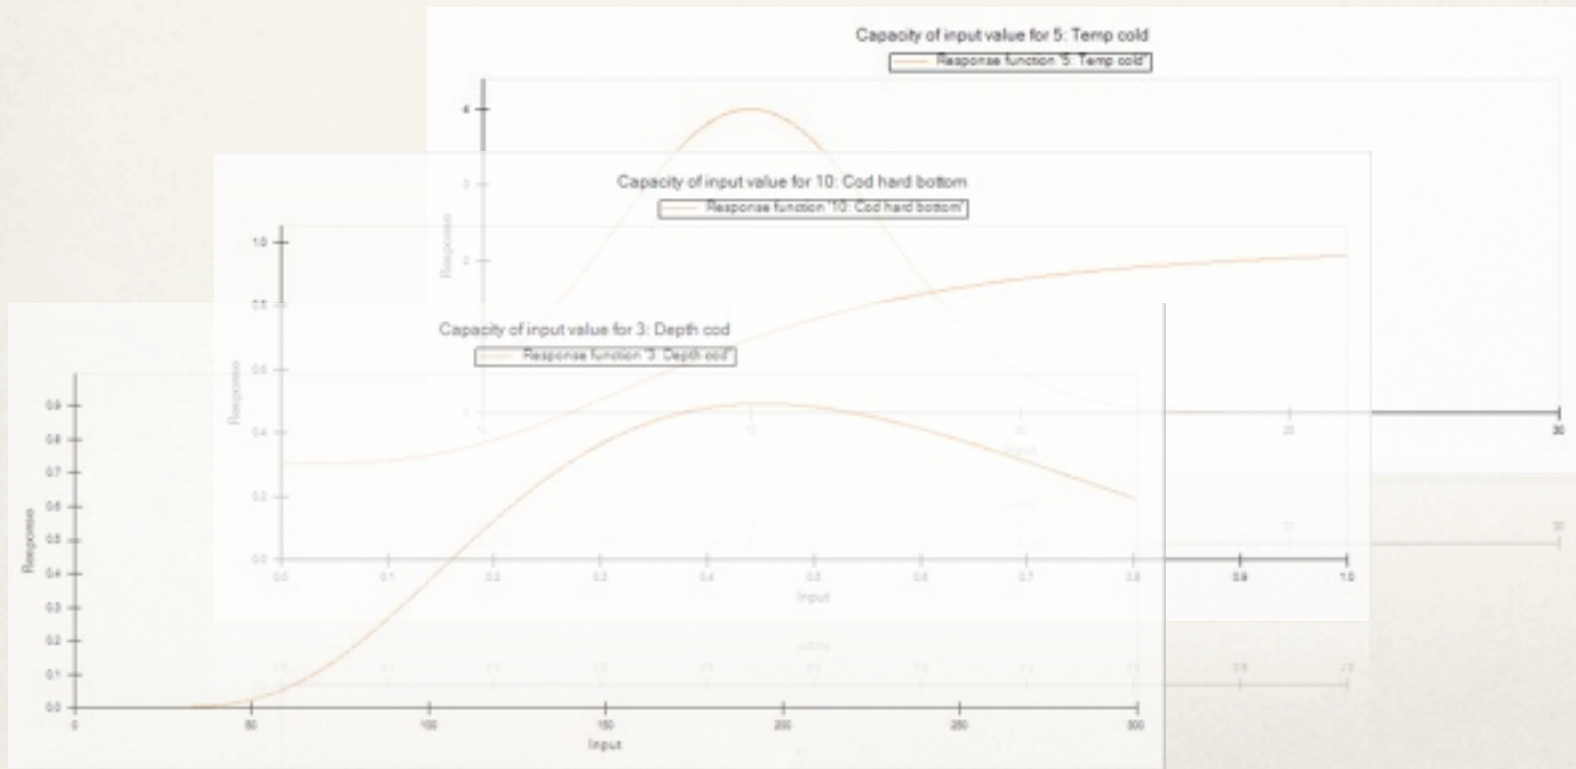

Sand bottom

Habitat capacity modeling in EwE

- Basically asks the question: “why are the species where they are?”
- Spatial foraging arena use can be defined based on environmental factors

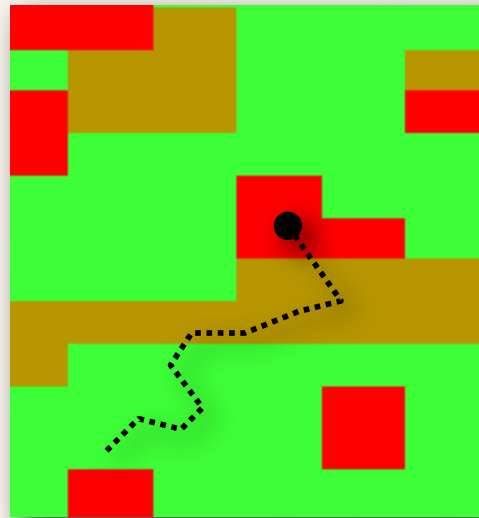

Habitat capacity: biomass maps

Ecospace IBM representation

State of each packet over time is represented by:

- X,Y position (spatial cell)
- Number of fish
- Mean body weight
- Age (stanza)

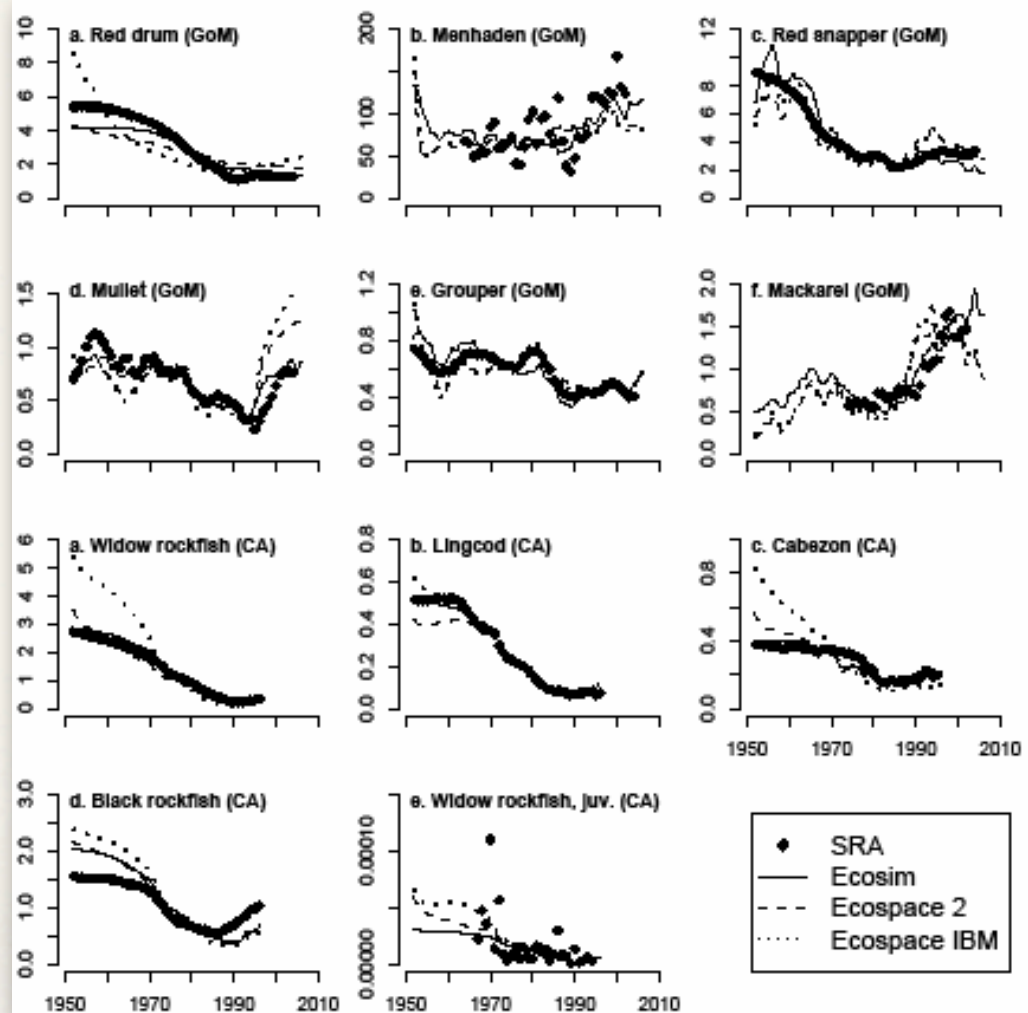

Spatial cells encountered by the packet vary in:

- habitat characteristics
- prey densities
- predation risk
- fishing effort

Movement rules include random direction change (diffusion), oriented seasonal migration movement, and fitness gradient moves (toward cells with higher fitness as measured by the ratio (food availability)/(predation risk))

SRA, Ecosim, Ecospace (& IBM) give similar time predictions and fits to

- Fits to historical stock reconstructions (SRA) and abundance trend indices for selected species, Gulf of Mexico and central California coast.

Modeling life history changes

- EwE uses multi-stanza formulation to model (key) groups where ontogenetic shifts are deemed important
- Has up to now been implemented using an age-based transition, but size-based is in the works

Multi-stanza groups: Size-based transitions is next

Edit Multi-Stanza Groups

Stanza group: 4: Red Drum

Curvature parameter, K (annual), from VBGF: 0.3230

Recruitment power: 1.0000

Relative biomass accumulation rate (BA/B): 0.0000

Wmaturity/Winf: 0.2000

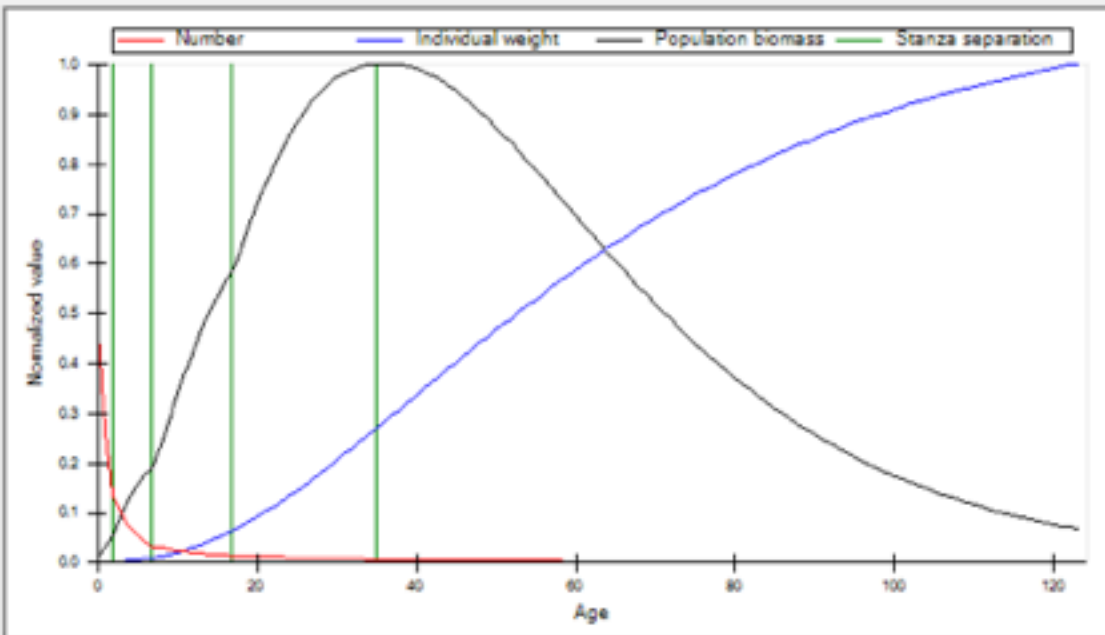

Fixed fecundity

Ecosim

Forcing function for hatchery stocking: Ecosim required

Eospace

Recruit where spawned in Eospace

| | Group name | Age, start (months) | Leading | Biomass (t/km ²) | Z (/year) | Leading | Consumption / biomass (/year) |
|----|----------------|---------------------|-------------------------------------|------------------------------|-----------|-------------------------------------|-------------------------------|
| 6 | 0-3 Red Drum | 0 | <input checked="" type="checkbox"/> | 0.0002739 | 8.0000 | <input checked="" type="checkbox"/> | 17.503 |
| 7 | 3-8 Red Drum | 3 | <input type="checkbox"/> | 0.004158 | 3.5000 | <input type="checkbox"/> | 5.9050 |
| 8 | 8-18 Red Drum | 8 | <input type="checkbox"/> | 0.02726 | 1.1000 | <input type="checkbox"/> | 2.6343 |
| 9 | 18-36 Red Drum | 18 | <input type="checkbox"/> | 0.1083 | 0.6000 | <input type="checkbox"/> | 1.5131 |
| 10 | 36+ Red Drum | 36 | <input type="checkbox"/> | 0.3004 | 0.5500 | <input type="checkbox"/> | 0.9790 |

Model comparison: EwE & Size

- Size-based and trophic models use different approaches for modeling
- Also similarities, e.g. size is implicitly considered in diet compositions, (which, however, also have implicit spatial overlap considerations)
- For comparisons, common metrics are important
 - EwE can produce size spectra as a standard output, would be interesting to compare with similar output from size-based models

Gulf of Thailand size spectra

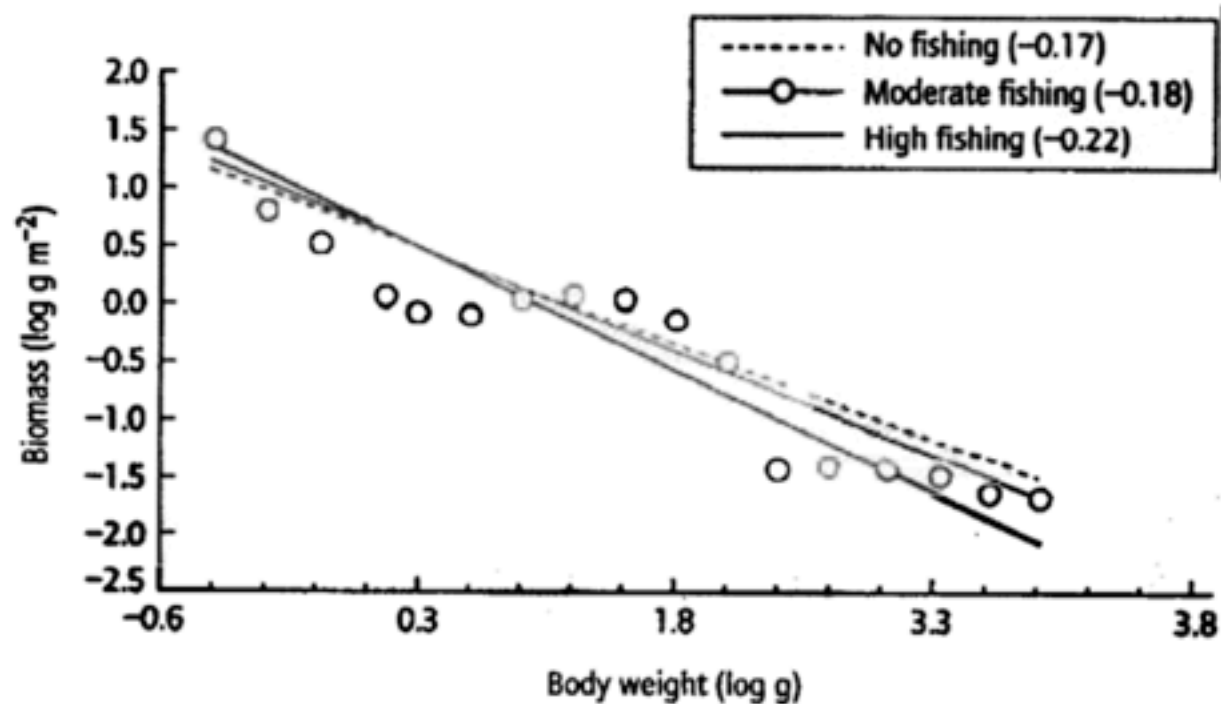

Fig. 10.2 Ecosystem-level size spectra for the Gulf of Thailand. The spectra are derived based on a trophic model with 40 ecosystem groupings (see www.ecopath.org). The thin line associated with 'moderate fishing' describes the 1973 situation in the Gulf, while the broken line indicates the slope of the model situation at long-term equilibrium without fishing, and the thick line indicates the 1994 situation, with resources severely depleted by over-fishing. Note that the slopes of the spectra (in brackets) increase with fishing pressure.
