Introduction and Aim

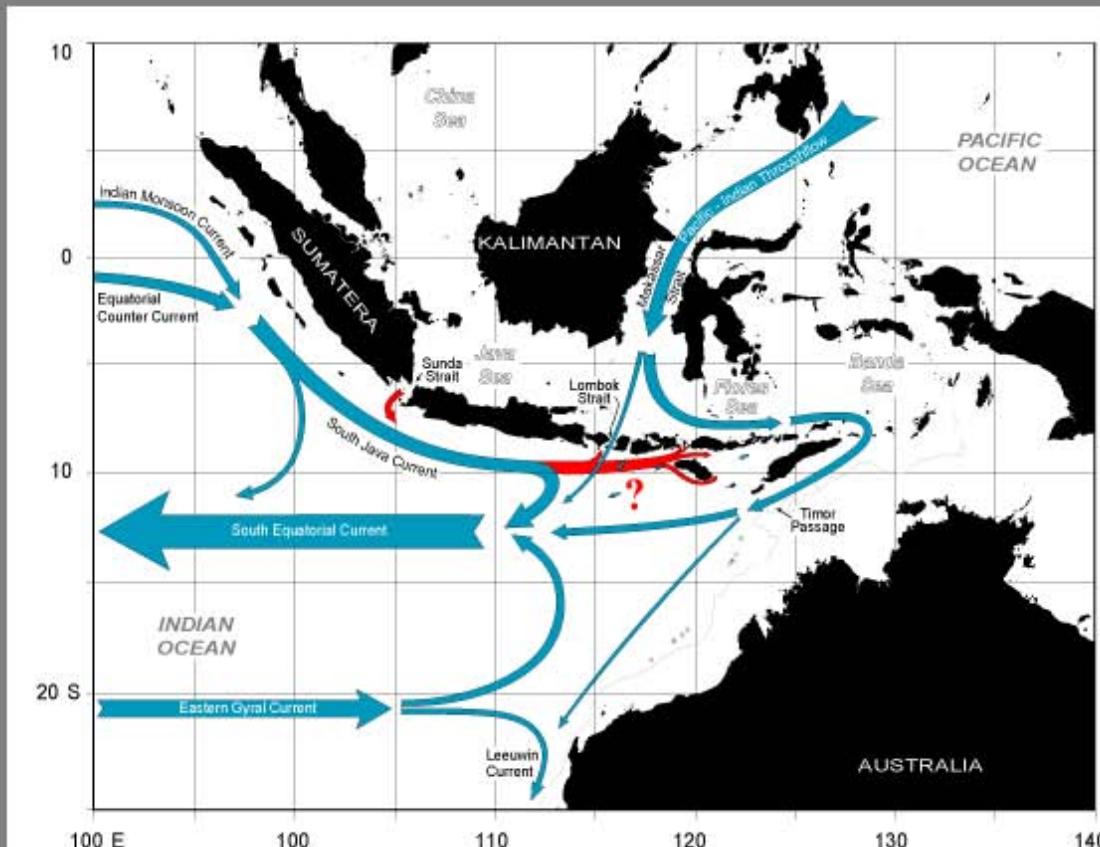

Science of the Protection of Indonesian Coastal Marine Ecosystems - A German-Indonesian Initiative in Earth System Research (2003 - 2007)

Marine ecological assessments of coral reefs, seagrass beds and plankton focussing on anthropogenic impacts, blast-fishing and land-based sources of pollution.

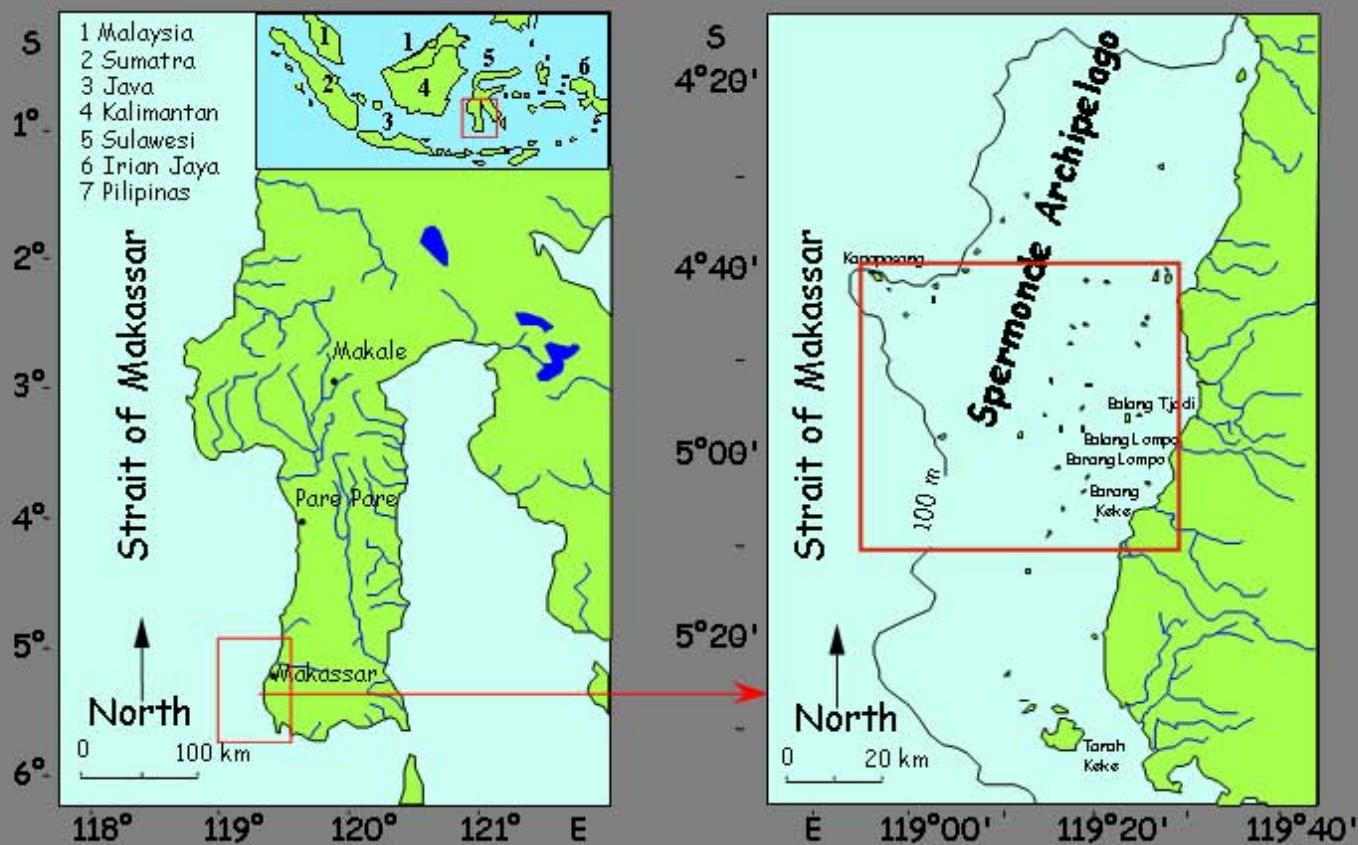

Zooplankton studies with focus on copepods and meroplanktonic larvae.

Is there a distinct separation between offshore and coastal regions in the copepod community structure?

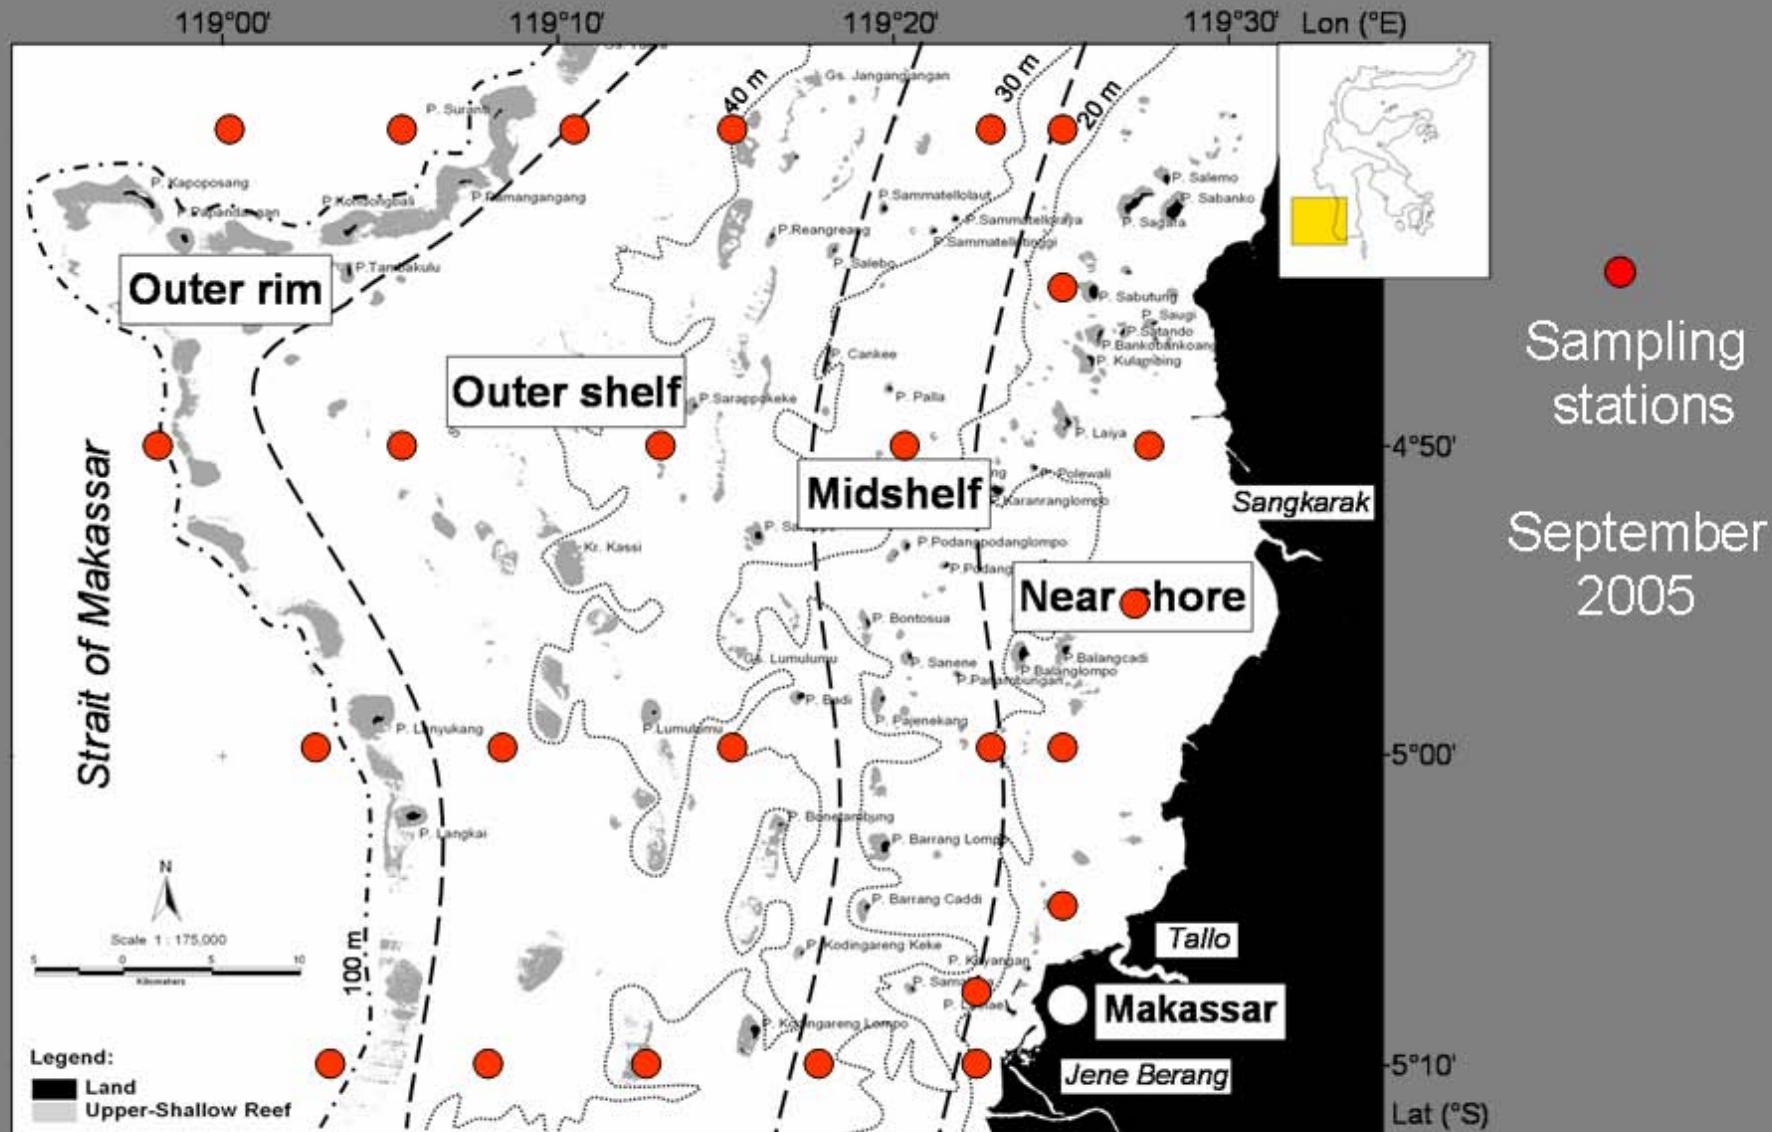

Indonesian Throughflow

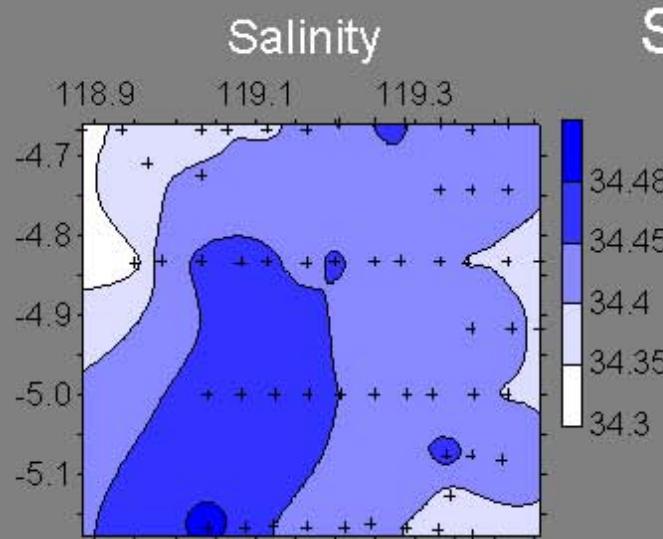

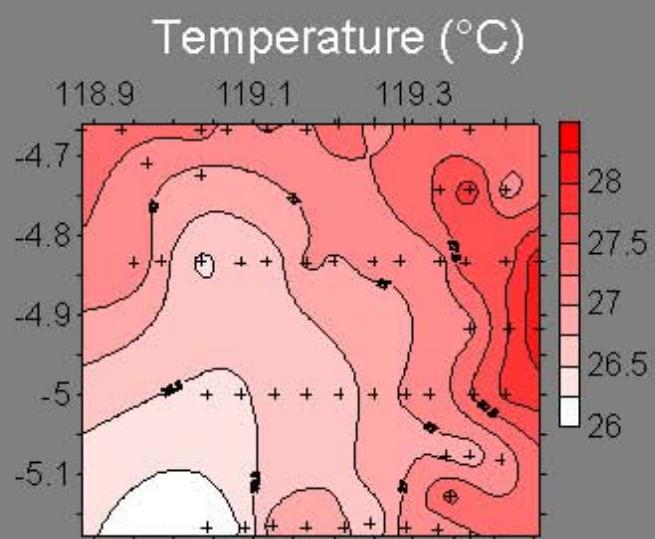

http://tryfan.ucsd.edu/woce_joe/woce_joe.htm

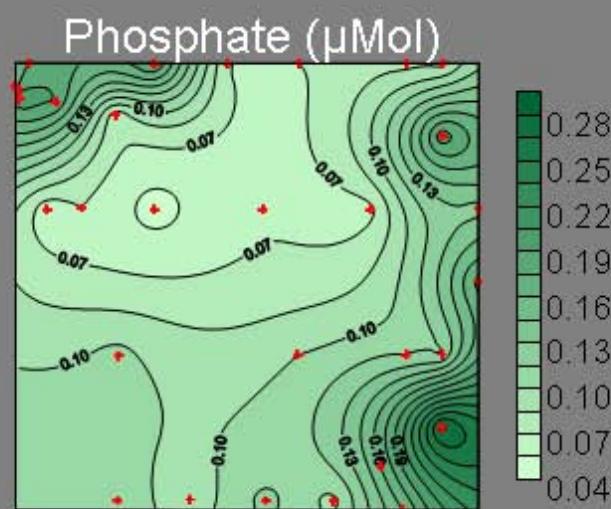

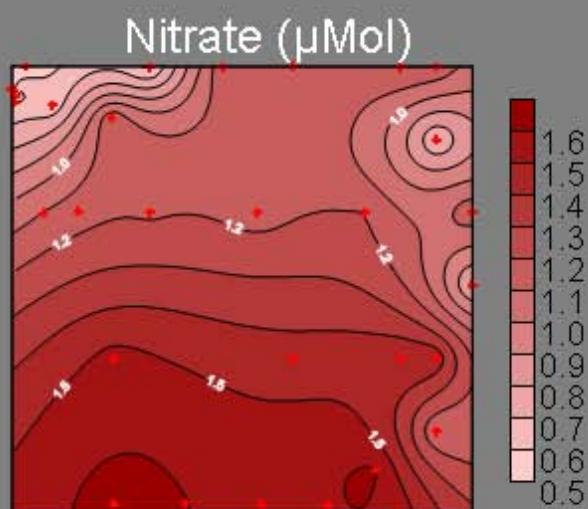

Spermonde Archipelago

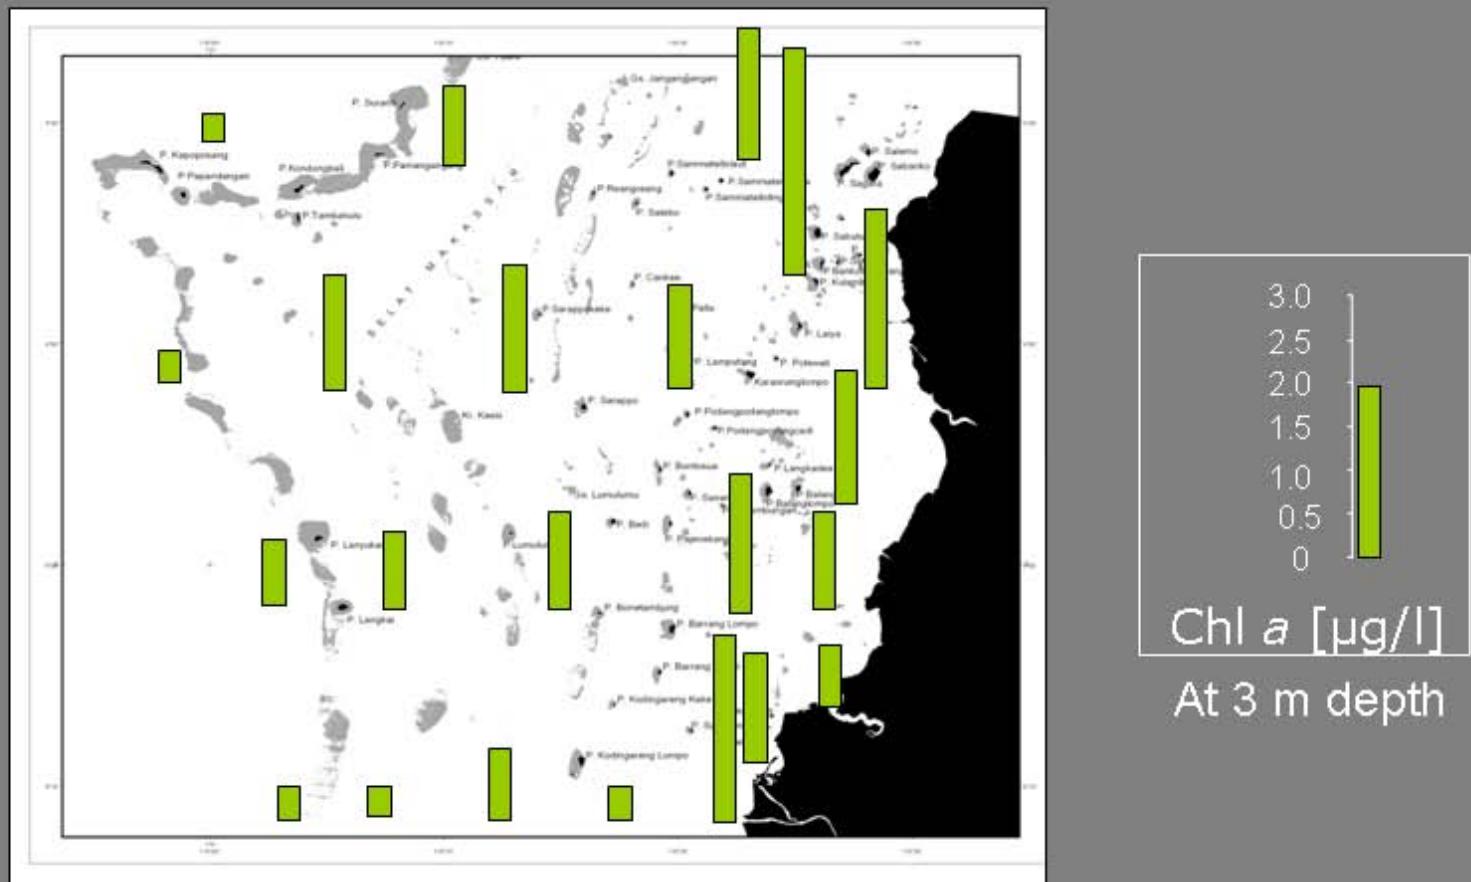

September 2005

September 2005

Summary

Chlorophyll *a* concentration higher near shore

Near shore area phosphate enriched

Temperature, Salinity and Nitrate show southern inflow of
colder, more saline and nitrate enriched water

SW inflow might be a result from a local upwelling
event during the SE Monsoon

Zooplankton sampling

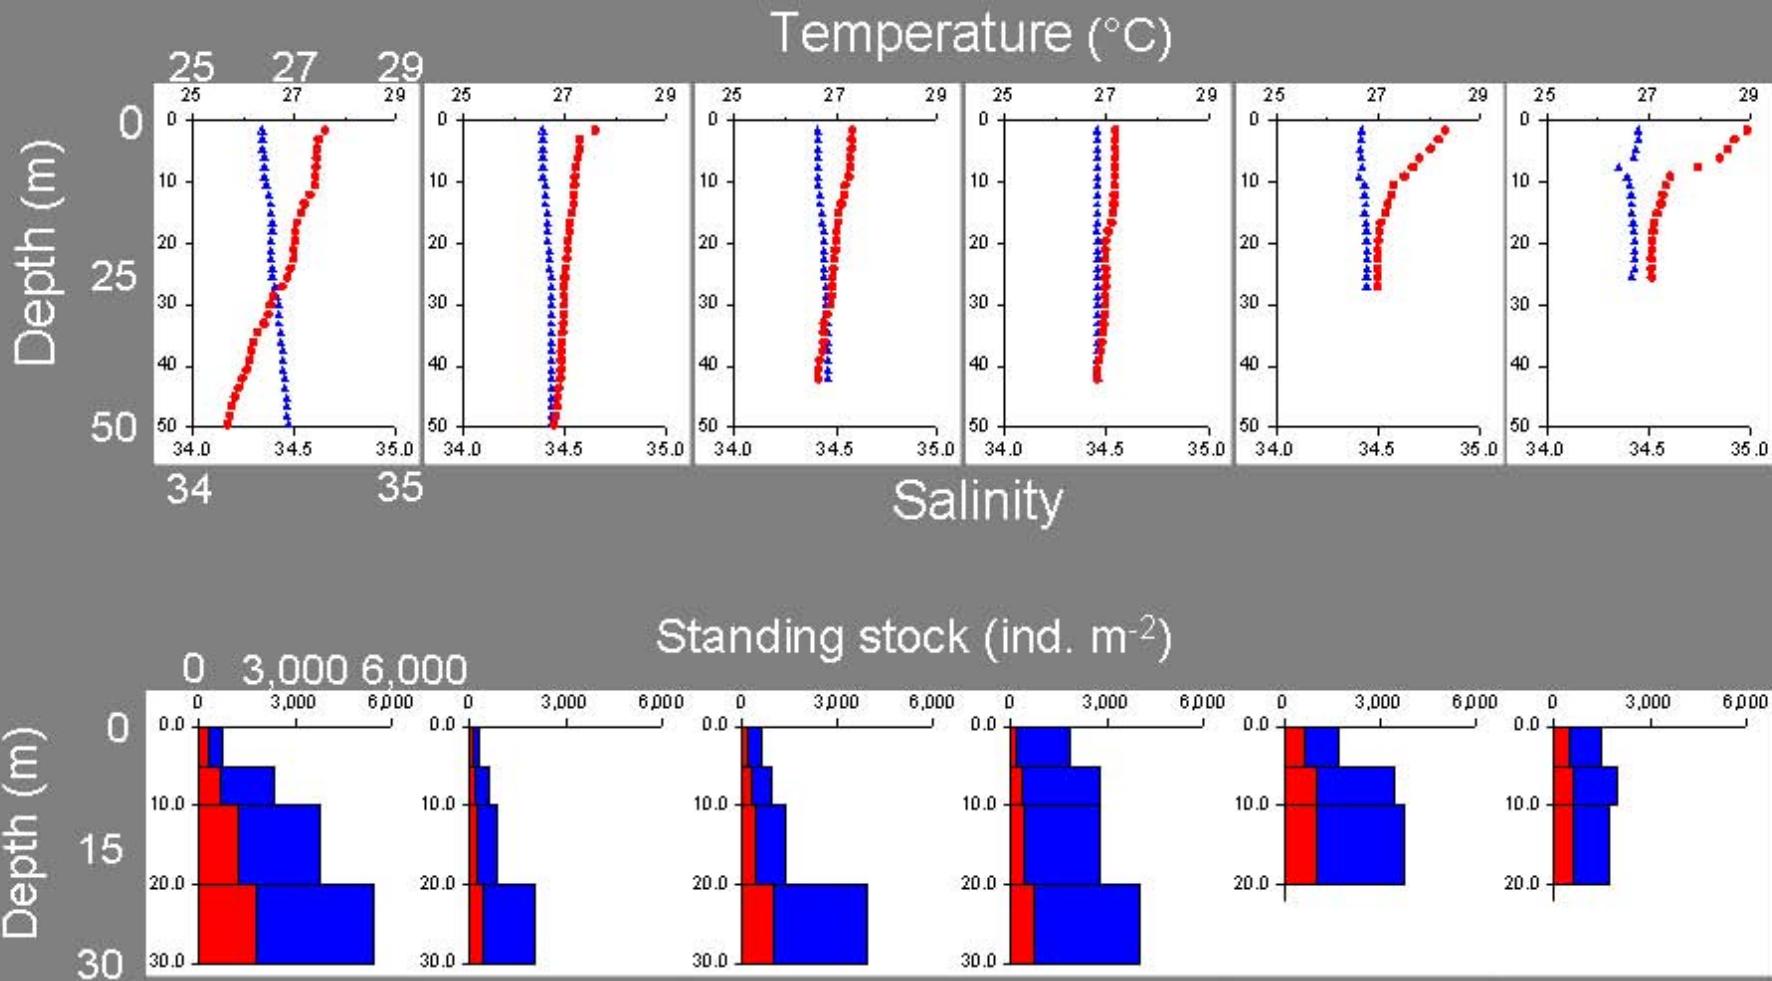

Sampling period: September 2005 (Dry season)

Zooplankton sampling:

- Apstein-net
- Mesh size 200 µm
- Stratified vertical tows

Species identification only for adult calanoid copepods

Vertical distribution

Total number of species: 67+ (+5 juvenile)

Dominant group with 15+ species:

Paracalanidae

Acrocalanus gibber
Acrocalanus gracilis
Acrocalanus longicornis
Acrocalanus monachus
Bestiolina similis
Calocalanus spp.
Calocalanus pavo
Calocalanus plumulosus
Delius nudus
Paracalanus cf. tropicus
Paracalanus aculeatus
Paracalanus denudatus
Paracalanus indicus
Parvocalanus crassirostris
Parvocalanus scotti

Other important species:

Canthocalanus pauper
Cosmocalanus darwini
Clausocalanus farrani
Clausocalanus furcatus
Metacalanus aurivilli
Temora turbinata
Acartia negligens
Acartia erythraea
Acartia pacifica
Tortanus gracilis

Species number:

- Near shore 9 – 20
- Midshelf 11 - 25
- Outer shelf 12 - 25
- Outer rim 21 - 36

Paracalanidae dominant at all stations: 70 – 90% of all adults

Dominant species:
(of all Calanoida)

- Paracalanus indicus* 9%
- Parvocalanus crassirostris* 8%
- Bestiolina similis* 6%
- Parvocalanus scotti* 4%
- Paracalanus cf. tropicus* 4%

Paracalanidae - Females

Paracalanus indicus

Paracalanus aculeatus

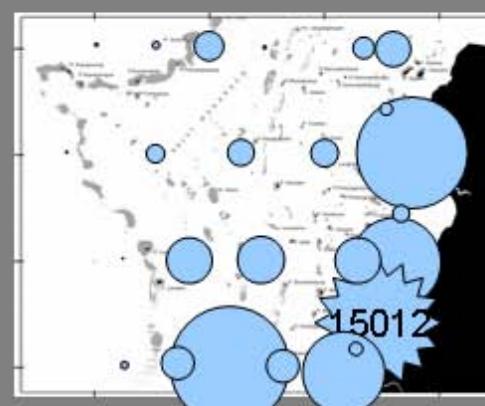

- 8000 ind. m⁻²
- 4000 ind. m⁻²
- 2000 ind. m⁻²

Bestiolina similis

Parvocalanus spp.

offshore

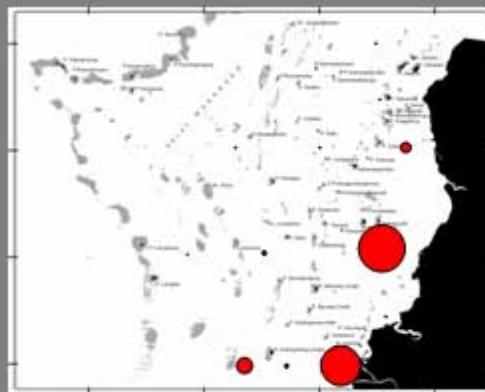

coastal

- Acartia danae*
- Acrocalanus longicornis*
- Calanopia australica*, *C. minor*
- Candacia catula*, *C. curta*,
C. pachydactyla
- Centropages calaninus*, *C. elongatus*
- Clausocalanus furcatus*,
C. mastigophorus
- Cosmocalanus darwini*
- Euchaeta media*
- Labidocera acuta*
- Mecynocera clausi*
- Pareucalanus attenuatus*, *P. sewelli*
- Rhincalanus rostrifrons*
- Scolecithricella timida*
- Scolecithrix danae*
- Subeucalanus crassus*, *S. mucronatus*,
S. pileatus, *S. subcrassus*
- Temora discaudata*, *T. stylifera*
- Undinula vulgaris*

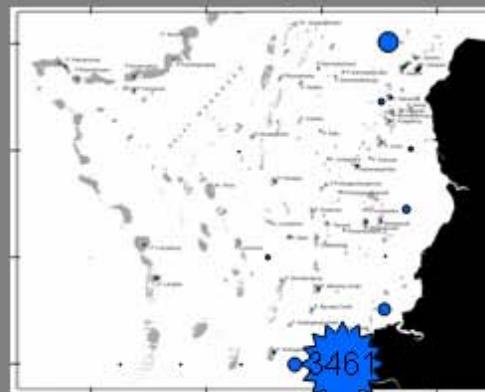

- Acartia erythraea*, *A. pacifica*
- Metacalanus aurivilli*
- Pseudodiaptomus aurivilli*, *P. clevei*
- Temora turbinata*
- Tortanus gracilis*, *T. barbatus*

Neritic species - Adults

Metacalanus aurivilli

Acartia erythraea

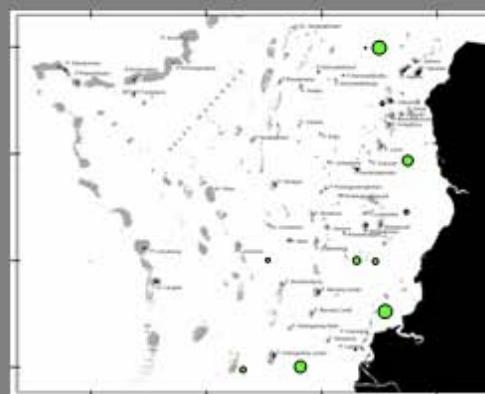

- 2000 ind. m⁻²
- 1000 ind. m⁻²
- 500 ind. m⁻²

Temora turbinata

Tortanus gracilis

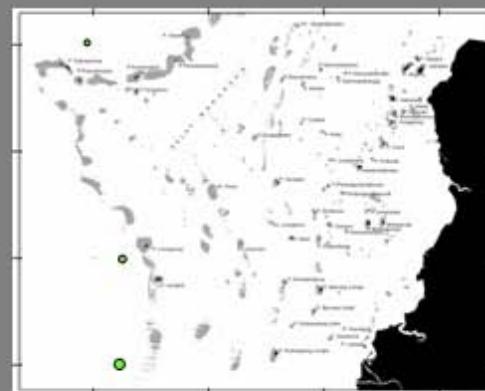

Oceanic Species - Adults

Clausocalanus farrani

Subeucalanus pileatus

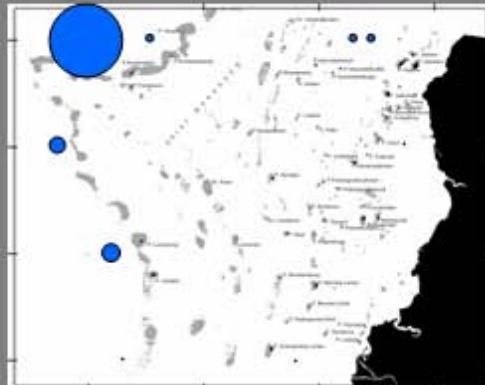

● 2000 ind. m⁻²

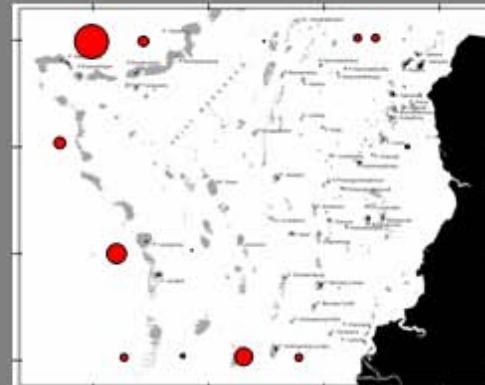

● 1000 ind. m⁻²

● 500 ind. m⁻²

Cosmocalanus darwini

Canthocalanus pauper

Higher abundance below 10 m at most stations

Species numbers distinctly higher at the offshore stations

Paracalanidae dominant at all stations, but importance differs

Offshore species composition considerably different from that of coastal stations

Other calanoid species are distinctly separated by their distribution

Conclusions

Clear separation between oceanic and coastal communities

Oceanic species hardly occur on the reef area

Coastal pollution probably does not result in a lower species number

Species of the Paracalanidae are not separated according to hydrography but rather by food preferences or competition

Thank you for your attention!!
