

Resolving the small-scale distribution of plankton and marine snow: Unravelling the role of thin layers using optical techniques

Klas Ove Möller, Christian Möllmann, Axel Temming and Michael St. John

Introduction: Thin Layers and their ecological role

- **„Thin Layers“** - vertically thin patches of organisms occurring on scales from tens/cm to m.

- Patchiness and spatial overlap are a key for predator prey interactions in stratified marine systems.
- Marine snow: aggregates of detritus, inorganic matter and microorganisms = potential food source for zooplankton (e.g. Dilling et al., 1998 / Wilson & Steinberg, 2010) - undersampled & underrated?

Aims of this study

- ***to resolve*** the vertical small-scale distribution of zooplankton and marine snow in a highly stratified marine ecosystem.
- ***to identify*** the zooplankton species utilizing thin layers and aggregations of marine snow.
- ***to elucidate*** trophic interactions relative to thin layers and patchiness.

Methods: The Video Plankton Recorder (VPR) Seascan Inc.

The Video Plankton Recorder

- Towed „underwater microscope“
- Equipped with CTD, Turbidity-, Fluorescence-, PAR-, and Flight-control sensors
- Images (25fps) are combined with sensor data from log file (1s)
- Image volume = 1.45ml (DoF 7x7mm)
- Real-time sampling via fibre-optics
- Non-destructive sampling of delicate organisms on small-scales

Methods: Data processing & classification

- „ROIs“ are extracted from each image

- Classifier categories: Copepoda, Marine snow, Blurry and „Other“
- Automatic classification of high abundant categories with dual classification (Support vector machine & Neural network) and automatic correction (Hu & Davis, 2006)
- Results were checked manually
- Groundtruthing was performed with a Multinet (300µm)

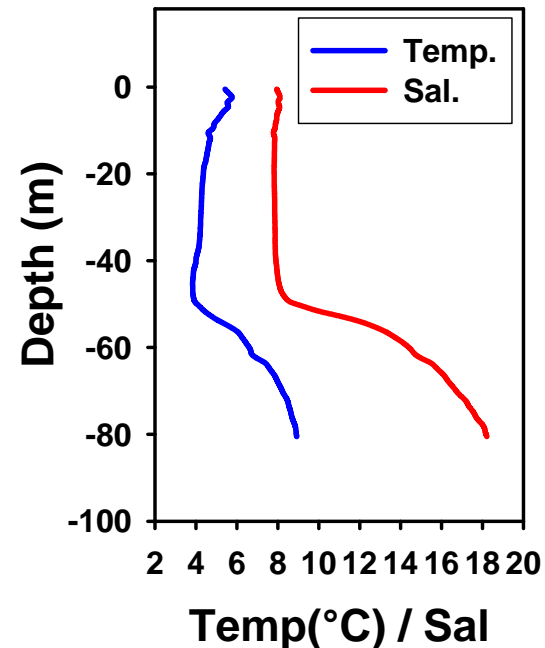

Images of taxonomic categories

The Baltic Sea

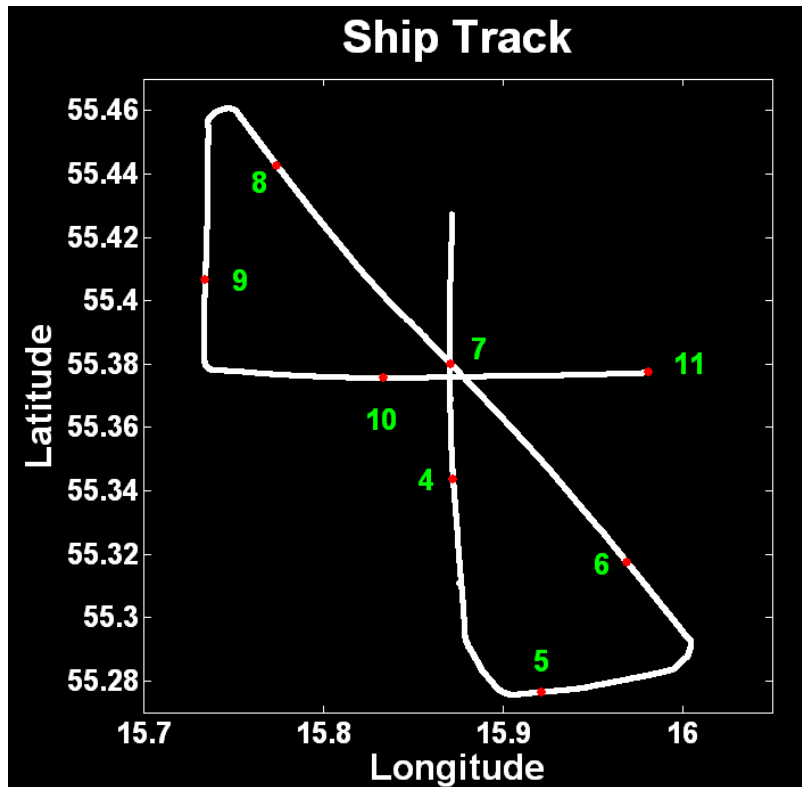

Vertical hydrographic Profile

- Largest brackish water system in the world.
- Characterised by strong thermal & saline gradients.
- Low oxygen concentrations below the halocline.
- Ventilation of deep basins depends on inflows from the North Sea.

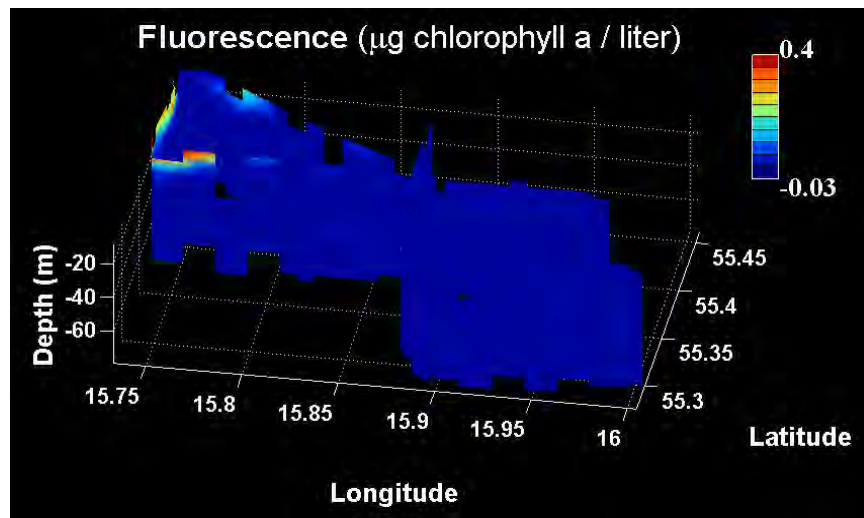

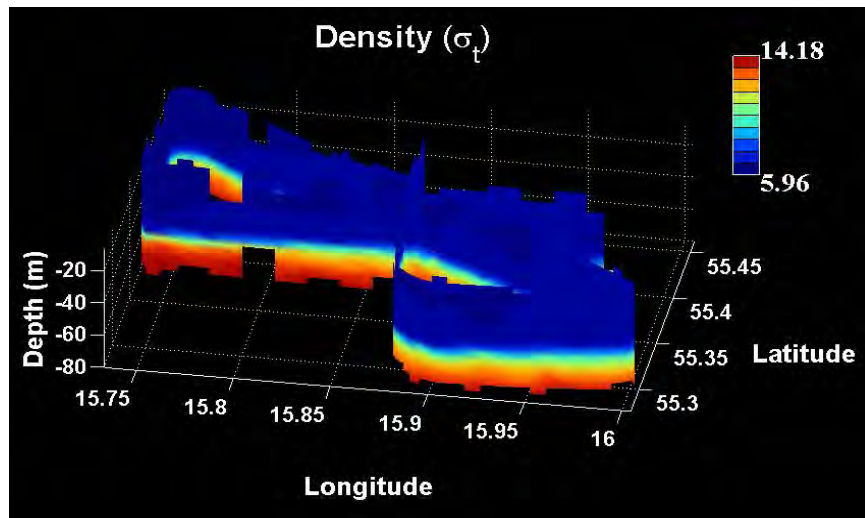

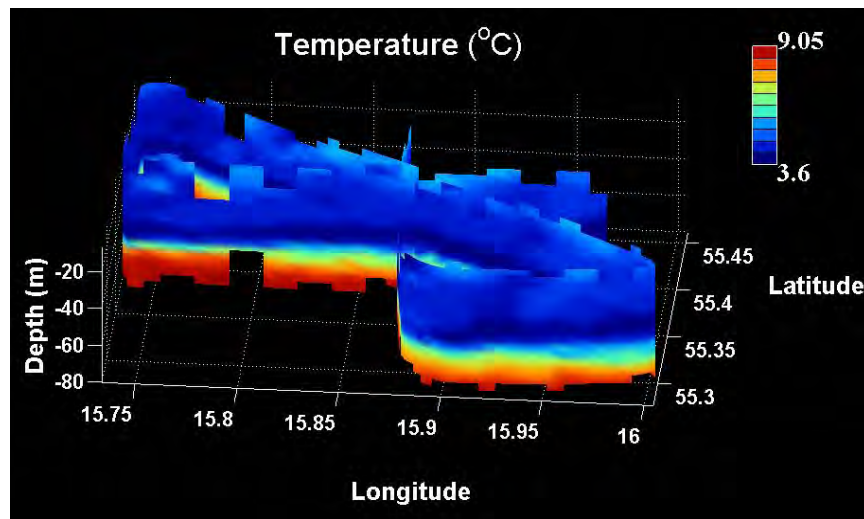

Sampling Design

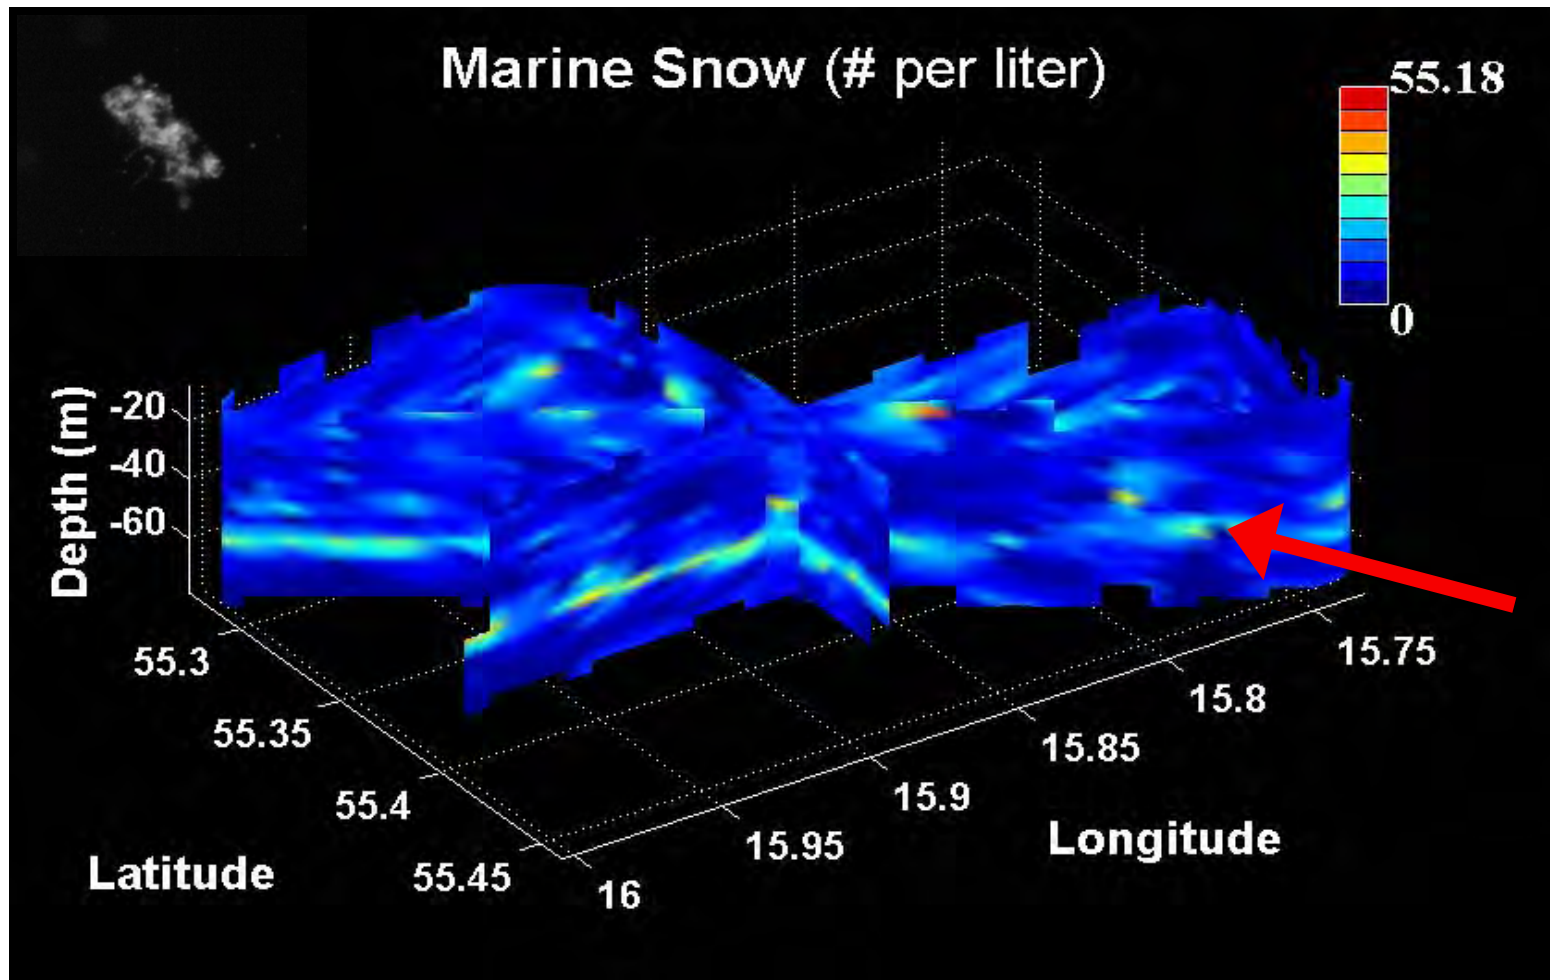

- Data was obtained during spring bloom conditions on a cruise on April 26th 2002 between 3am and 11am.
- The VPR was undulated from 8m above the bottom to 8m below the surface in relation to a permanent station in order to resolve vertical gradients.

| Tow # | Time | Total ROI # | Sampling Vol. (l) | Sampling depth (m) |
|-------|------|-------------|-------------------|--------------------|
| 3 | 08h | 40366 | 1691.7 | 75,1m |

Results: Hydrography - Strong vertical gradients

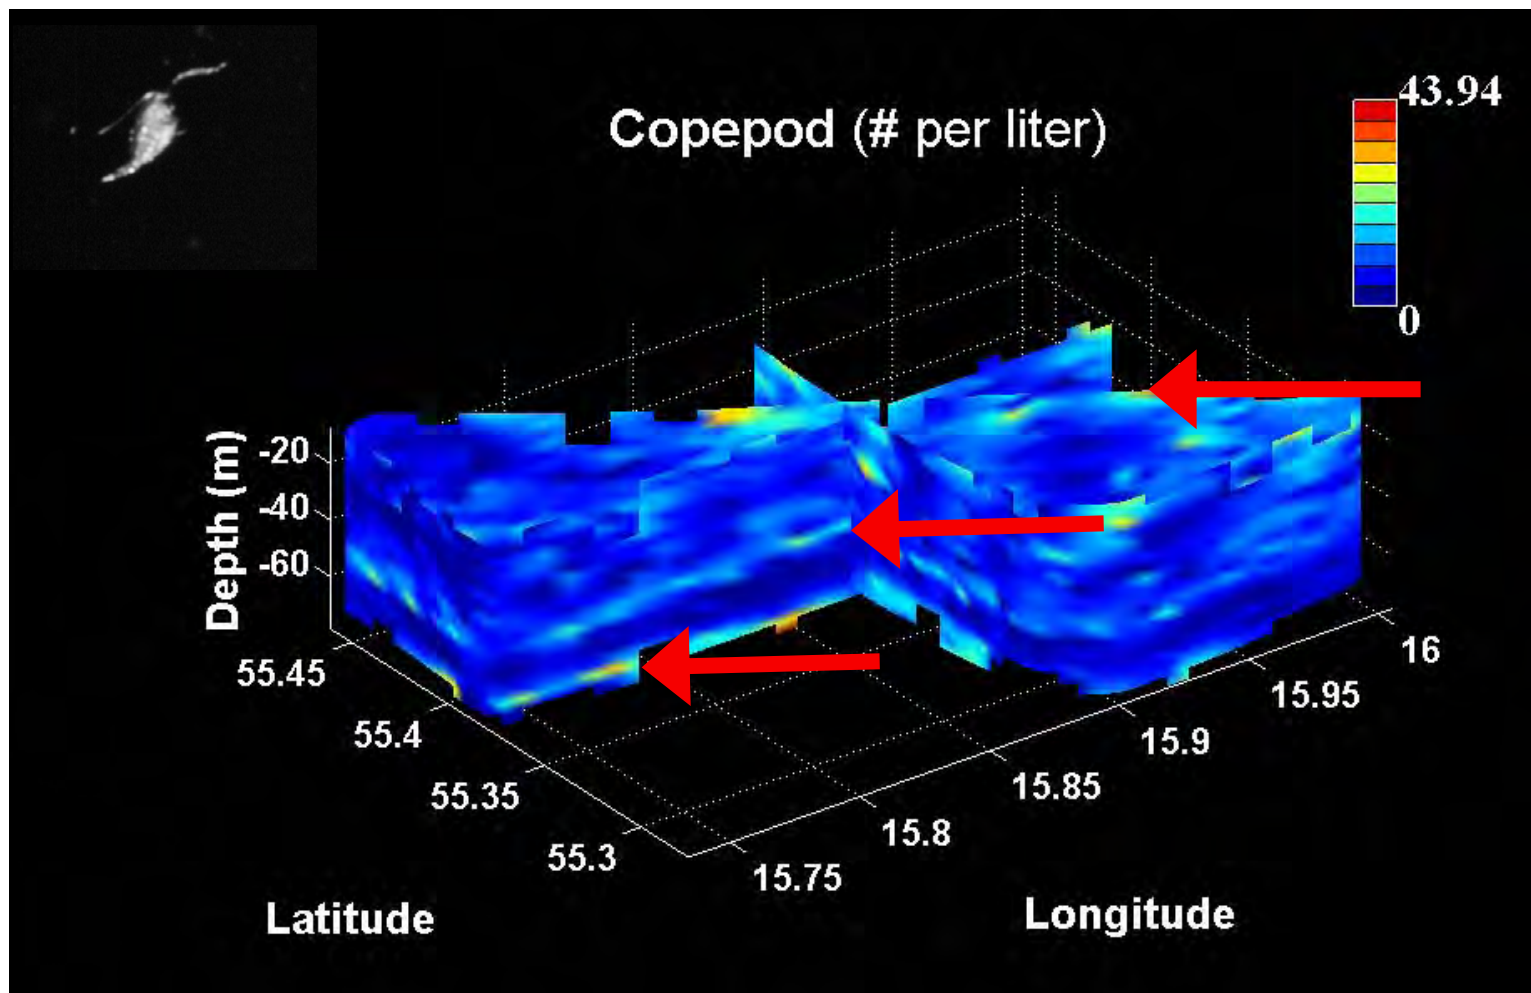

Results: Marine Snow Distribution

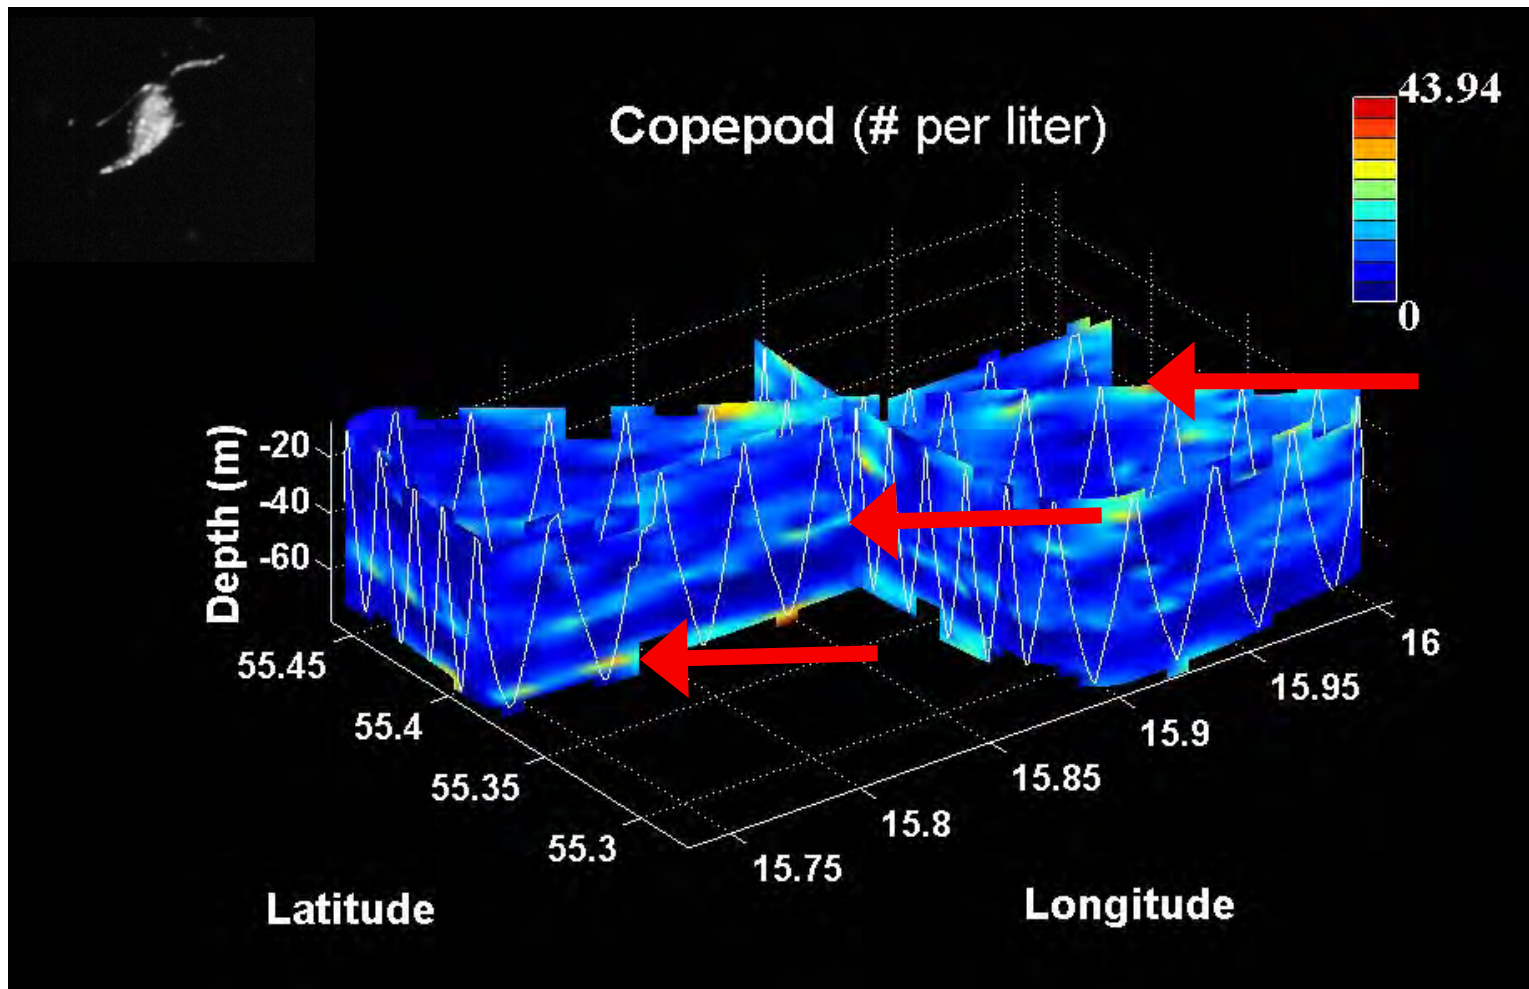

Results: Copepod Distribution

Results: Copepod Distribution

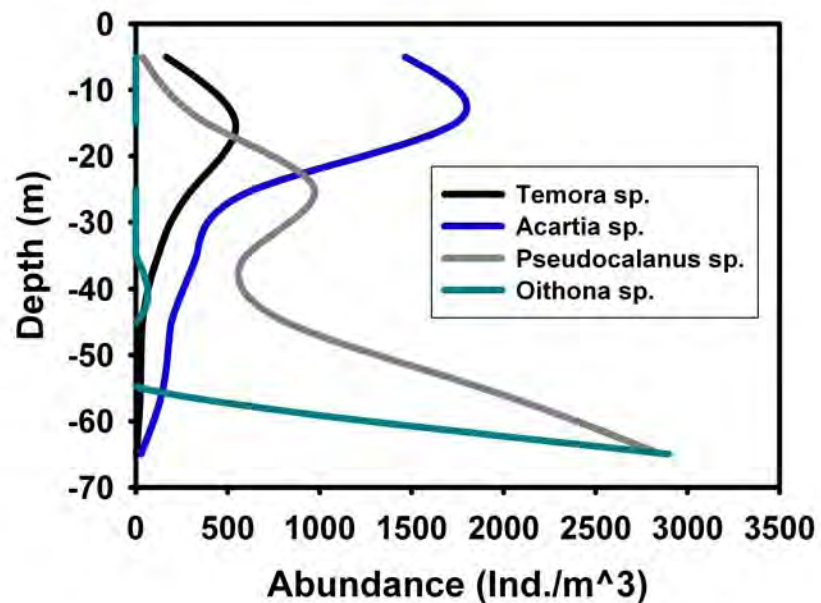

Results: Copepod Distribution

Results: Vertical distribution / species resolution

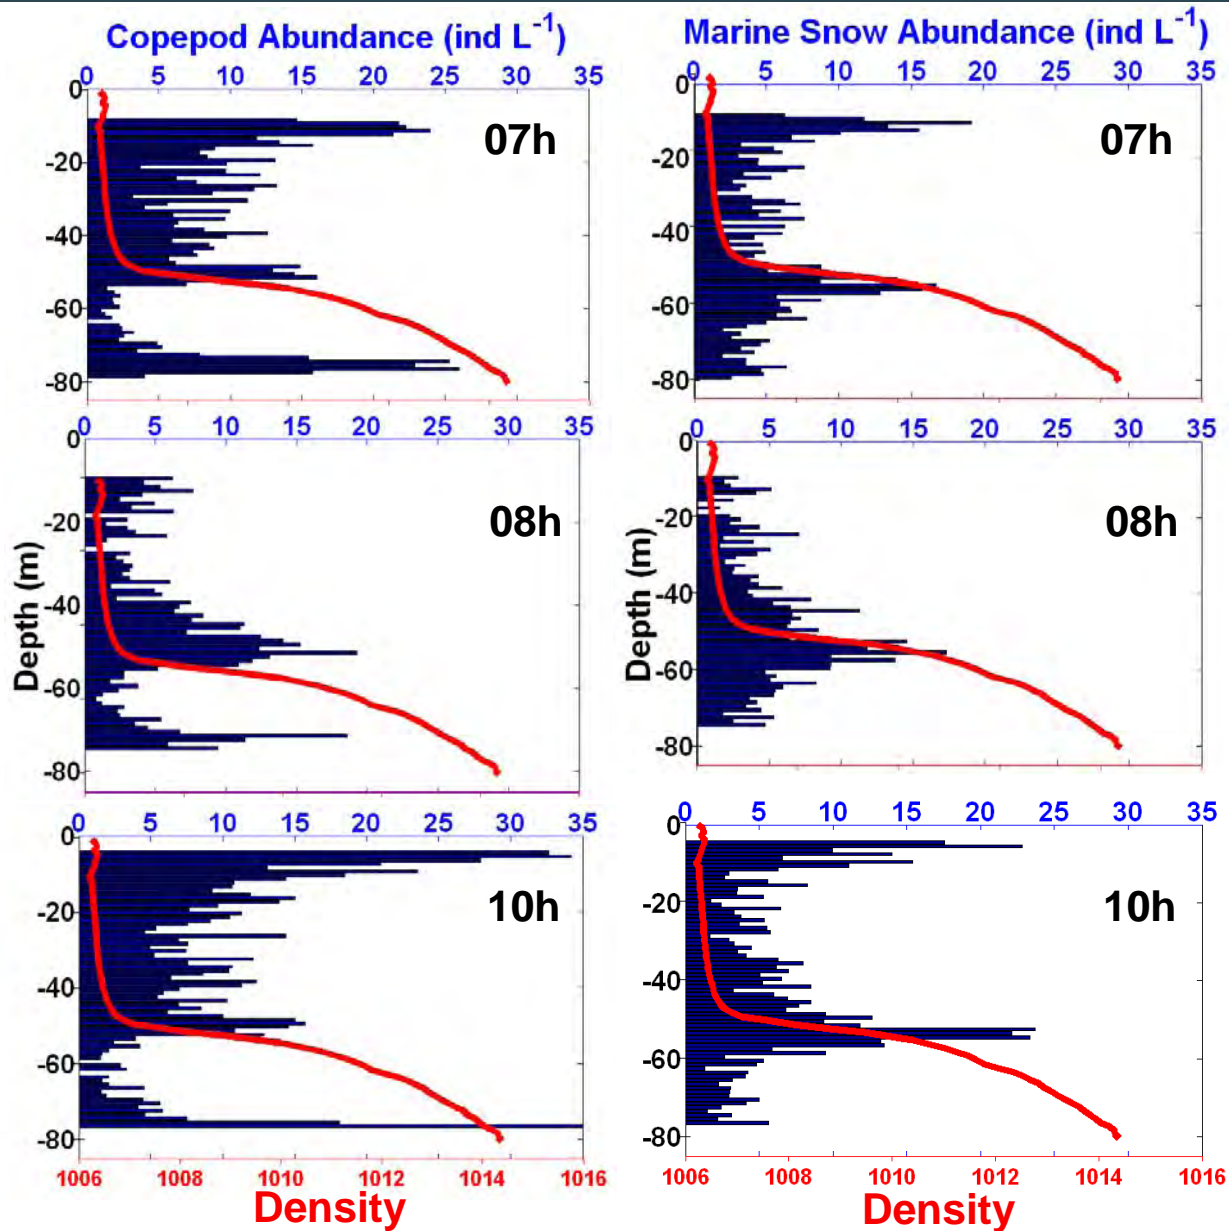

Copepod species distribution from Multinet

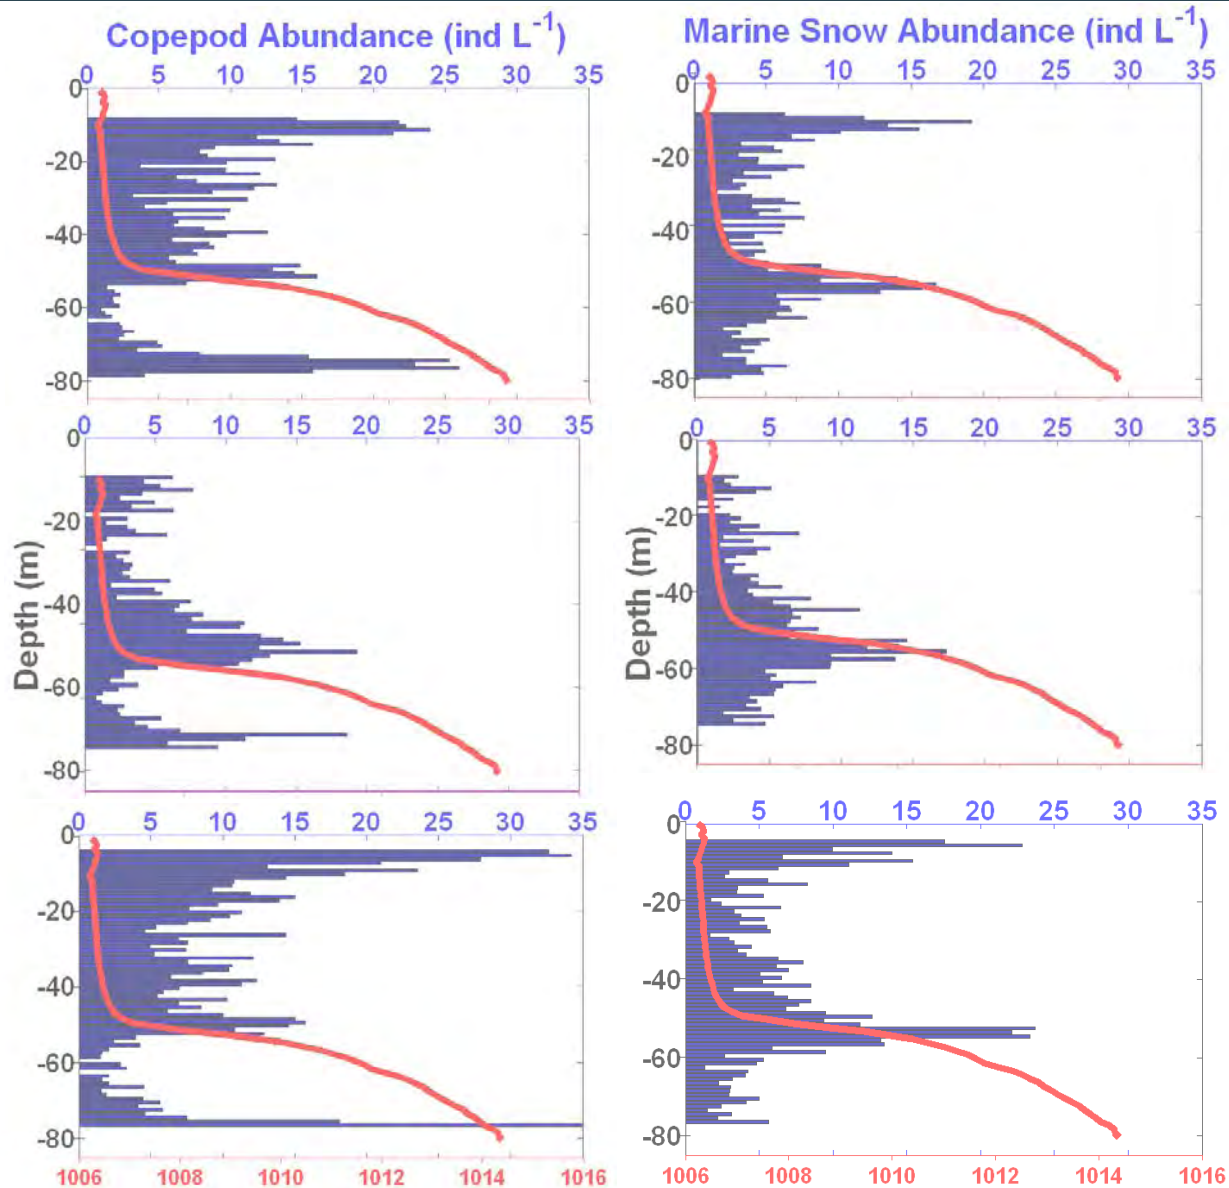

- Species specific abundance patterns can be related to thin layers and water column characteristics.

Results: Vertical distribution

Results: Vertical distribution

Correlation Coefficients

| Hour 07 | Copepod |
|-------------|---------|
| Marine snow | 0,22 |
| Density | -0,18 |
| Temperature | -0,07 |
| Salinity | -0,17 |

| Hour 08 | Copepod |
|-------------|---------|
| Marine snow | 0,25 |
| Density | -0,02 |
| Temperature | -0,11 |
| Salinity | -0,03 |

| Hour 10 | Copepod |
|-------------|---------|
| Marine snow | 0,35 |
| Density | -0,28 |
| Temperature | -0,12 |
| Salinity | -0,26 |

Results: Ecological Interactions

- Feeding on/in marine snow
- Spatial overlap & interaction
- Non-disturbed behaviour i.e. feeding position of antenna

Summary

...to resolve the vertical small-scale distribution of zooplankton and marine snow in a highly stratified marine ecosystem:

- **First observations showing pronounced thin layers of zooplankton and organic particles in the Baltic Sea.**

...to identify the zooplankton species utilizing thin layers and aggregations of marine snow:

- **Species specific overlap with thin layers of marine snow were identified.**

...to elucidate trophic interactions relative to thin layers and patchiness:

- **Indications of marine snow as a potential food source for *Pseudocalanus* sp. in thin layers in the Baltic Sea.**

Thank You!
